The geometry package

Hideo Umeki

https://github.com/davidcarlisle/geometry

2020/01/02 v5.9

Abstract

This package provides a flexible and easy interface to page dimensions. You can change the page layout with intuitive parameters. For instance, if you want to set a margin to 2cm from each edge of the paper, you can type just \usepackage[margin=2cm]{geometry}. The page layout can be changed in the middle of the document with \newgeometry command.

1 Preface to version 5

- **Changing page layout mid-document.**
  The new commands \newgeometry{} and \restoregeometry allow users to change page dimensions in the middle of the document. \newgeometry is almost similar to \geometry except that \newgeometry disables all the options specified in the preamble and skips the papersize-related options: landscape, portrait and paper size options (such as papersize, paper=a4paper and so forth).

- **A new set of options to specify the layout area.**
  The options specified for the area, in which the page dimensions are calculated, are added: layout, layoutsize, layoutwidth, layoutheight and so forth. These options would help to print the specified layout to a different sized paper. For example, with a4paper and layout=a5paper, the geometry package uses ‘A5’ layout to calculate margins with the paper size still ‘A4’.

- **A new driver option xetex.**
  The new driver option xetex is added. The driver auto-detection routine has been revised so as to avoid an error with undefined control sequences. Note that ‘geometry.cfg’ in \TeX\ Live, which disables the auto-detection routine and sets pdftex, is no longer necessary and has no problem even though it still exists. To set xetex is strongly recommended with X\La\TeX.

- **New paper size presets for JIS B-series and ISO C-series.**
  The papersize presets b0j to b6j for JIS (Japanese Industrial Standards) B-series and c0paper to c6paper for ISO C-series (v5.4~) are added.

- **Changing default for underspecified margin.**
  In the previous version, if only one margin was specified, bottom=1cm for example, then geometry set the other margin with the margin ratio (1:1 by default for the vertical dimensions) and got top=1cm in this case. The version 5 sets the text-body size with the default scale (= 0.7) and determine the unspecified margin. (See Section 6.5)

- **The option showframe and showcrop works on every page.**
  With showframe option, the page frames are shown on every page. In addition, a new option showcrop prints crop marks at each corner of layout area on every page. Note that the marks would be invisible without specifying the layout size smaller than paper size. Version 5.4 introduced a new \shipout overloading process using atbegshi package, so the atbegshi package is required when showframe or showcrop option is specified.

- **Loading geometry.cfg precedes processing class options.**
  The previous version loaded geometry.cfg after processing the document class options. Now that the config file is loaded before processing the class options, you can change the behavior specified in geometry.cfg by adding options into \documentclass as well as \usepackage and \geometry.
• Deleted options: compat2 and twosideshift. The version 5 has no longer compatibility with the previous ones. compat2 and twosideshift are gone for simplicity.

2 Introduction

To set dimensions for page layout in LaTeX is not straightforward. You need to adjust several LaTeX native dimensions to place a text area where you want. If you want to center the text area in the paper you use, for example, you have to specify native dimensions as follows:

```latex
\usepackage{calc}
\setlength{\textwidth}{7in}
\setlength{\textheight}{10in}
\setlength{\oddsidemargin}{(\paperwidth-\textwidth)/2 - 1in}
\setlength{\topmargin}{(\paperheight-\textheight - \headheight - \headsep - \footskip)/2 - 1in}.
```

Without package calc, the above example would need more tedious settings. Package geometry provides an easy way to set page layout parameters. In this case, what you have to do is just

```latex
\usepackage[text={7in,10in},centering]{geometry}.
```

Besides centering problem, setting margins from each edge of the paper is also troublesome. But geometry also make it easy. If you want to set each margin to 1.5in, you can type

```latex
\usepackage[margin=1.5in]{geometry}
```

Thus, the geometry package has an auto-completion mechanism, in which unspecified dimensions are automatically determined. The geometry package will be also useful when you have to set page layout obeying the following strict instructions: for example,

*The total allowable width of the text area is 6.5 inches wide by 8.75 inches high. The top margin on each page should be 1.2 inches from the top edge of the page. The left margin should be 0.9 inch from the left edge. The footer with page number should be at the bottom of the text area.*

In this case, using geometry you can type

```latex
\usepackage[total={6.5in,8.75in},
top=1.2in, left=0.9in, includefoot]{geometry}.
```

Setting a text area on the paper in document preparation system has some analogy to placing a window on the background in the window system. The name ‘geometry’ comes from the \-geometry option used for specifying a size and location of a window in X Window System.

3 Page geometry

Figure 1 shows the page layout dimensions defined in the geometry package. The page layout contains a total body (printable area) and margins. The total body consists of a body (text area) with an optional header, footer and marginal notes (marginpar). There are four margins: left, right, top and bottom. For twosided documents, horizontal margins should be called inner and outer.

```
paper : total body and margins
total body : body (text area) (optional head, foot and marginpar)
margins : left (inner), right (outer), top and bottom
```

Each margin is measured from the corresponding edge of a paper. For example, left margin (inner margin) means a horizontal distance between the left (inner) edge of the paper and that of the total body. Therefore the left and top margins defined in geometry are different from the native dimensions `\leftmargin` and `\topmargin`. The size of a body (text area) can be modified by `\textwidth` and `\textheight`. The dimensions for paper, total body and margins have the following relations.

\[ \text{paperwidth} = \text{left} + \text{width} + \text{right} \] \hspace{1cm} (1)
\[ \text{paperheight} = \text{top} + \text{height} + \text{bottom} \] \hspace{1cm} (2)
Figure 1: Dimension names used in the geometry package. width = textwidth and height = \text{textheight} by default. left, right, top and bottom are margins. If margins on verso pages are swapped by \texttt{twoside} option, margins specified by \texttt{left} and \texttt{right} options are used for the inside and outside margins respectively. \texttt{inner} and \texttt{outer} are aliases of \texttt{left} and \texttt{right} respectively.

(a) \texttt{default} \hspace{2cm} (b) includehead and includefoot

Figure 2: \texttt{includehead} and \texttt{includemargin} include the head and foot respectively into \textit{total body}. (a) height = \text{textheight} (default). (b) height = \text{textheight} + headheight + headsep + footskip if \texttt{includehead} and \texttt{includemargin}. If the top and bottom margins are specified, \texttt{includehead} and \texttt{includemargin} result in shorter \text{textheight}.

The total body width and height would be defined:

\[
width := \text{textwidth} + \text{marginparsep} + \text{marginparwidth} \quad (3)
\]
\[
height := \text{textheight} + \text{headheight} + \text{headsep} + \text{footskip} \quad (4)
\]

In Equation (3) width := textwidth by default, while marginparsep and marginparwidth are included in width if includemargin option is set true. In Equation (4), height := textheight by default. If includehead is set to true, headheight and headsep are considered as a part of height. In the same way, includemargin takes footskip into height. Figure 2 shows how these options work in the vertical direction.

Thus, the page layout consists of three parts (lengths) in each direction: one body and two margins. If the two of them are explicitly specified, the other length is obvious and no need to be specified. Figure 3 shows a simple model of page dimensions. When a length $L$ is given and is partitioned into the body $b$, the margins $a$ and $c$, it’s obvious that

\[
L = a + b + c \quad (5)
\]

The specification with two of the three (a, b and c) fixed explicitly is solvable. If two or more are left unspecified or ‘underspecified’, Equation (5) cannot be solved without any other relation between them. If all of them are specified, then it needs to check whether or not they satisfy Equation (5), that is too much specification or ‘overspecified’.
The `geometry` package has auto-completion mechanism that saves the trouble of specifying the page layout dimensions. For example, you can set
\[
\text{\texttt{\usepackage[width=14cm, left=3cm]{geometry}}}
\]
on A4 paper. In this case you don’t have to set the right margin The details of auto-completion will be described in Section 6.5.

4 User interface

4.1 Commands

The `geometry` package provides the following commands:

- \texttt{\geometry{⟨options⟩}}
- \texttt{\newgeometry{⟨options⟩} and \restoregeometry}
- \texttt{\savegeometry{⟨name⟩} and \loadgeometry{⟨name⟩}}

\texttt{\geometry{⟨options⟩}} changes the page layout according to the options specified in the argument. This command, if any, should be placed only in the preamble (before \texttt{\begin{document}}).

The `geometry` package may be used as part of a class or another package you use in your document. The command \texttt{\geometry} can overwrite some of the settings in the preamble. Multiple use of \texttt{\geometry} is allowed and then processed with the options concatenated. If \texttt{\geometry} is not yet loaded, you can use only \texttt{\usepackage{⟨options⟩}} instead of \texttt{\geometry}.

\texttt{\newgeometry{⟨options⟩}} changes the page layout mid-document. \texttt{\newgeometry} is almost similar to \texttt{\geometry} except that \texttt{\newgeometry} disables all the options specified by \texttt{\usepackage} and \texttt{\geometry} in the preamble and skips papersize-related options. \texttt{\restoregeometry} restores the page layout specified in the preamble. This command has no arguments. See Section 7 for details.

\texttt{\savegeometry{⟨name⟩}} saves the page dimensions as ⟨name⟩ where you put this command. \texttt{\loadgeometry{⟨name⟩}} loads the page dimensions saved as ⟨name⟩. See Section 7 for details.

4.2 Optional argument

The `geometry` package adopts \texttt{keyval} interface ‘⟨key⟩=⟨value⟩’ for the optional argument to \texttt{\usepackage}, \texttt{\geometry} and \texttt{\newgeometry}.

The argument includes a list of comma-separated \texttt{keyval} options and has basic rules as follows:

- Multiple lines are allowed, while blank lines are not.
- Any spaces between words are ignored.
- Options are basically order-independent. (There are some exceptions. See Section 6.2 for details.)

For example,
\[
\text{\texttt{\usepackage[ a5paper , hmargin = { 3cm, .8in } , height = 10in ]{geometry}}}
\]
is equivalent to
\[
\text{\texttt{\usepackage[height=10in,a5paper,hmargin={3cm,0.8in}]{geometry}}}
\]
Some options are allowed to have sub-list, e.g. ⟨3cm,0.8in⟩. Note that the order of values in the sub-list is significant. The above setting is also equivalent to the followings:
or
\usepackage[a5paper]{geometry}
\geometry{hmargin={3cm,0.8in},height=8in}
\geometry{height=10in}.

Thus, multiple use of \geometry just appends options.
\geometry supports package \texttt{calc}\footnote{CTAN: macros/latex/required/tools}. For example,
\begin{verbatim}
\usepackage{calc}
\usepackage[textheight=20\baselineskip+10pt]{geometry}
\end{verbatim}

\section{4.3 Option types}

\texttt{geometry} options are categorized into four types:

\begin{enumerate}
\item \textbf{Boolean type}
takes a boolean value (\texttt{true} or \texttt{false}). If no value, \texttt{true} is set by default.
\begin{itemize}
\item \texttt{\{key\}=true | false.}
\item \texttt{\{key\}} with no value is equivalent to \texttt{\{key\}=true.}
\end{itemize}
\textit{Examples:} verbose=true, includehead, twoside=false.

\item \textbf{Single-valued type}
takes a mandatory value.
\begin{itemize}
\item \texttt{\{key\}=(value).}
\end{itemize}
\textit{Examples:} width=7in, left=1.25in, footskip=1cm, height=.86\paperheight.

\item \textbf{Double-valued type}
takes a pair of comma-separated values in braces. The two values can be shortened to one value if they are identical.
\begin{itemize}
\item \texttt{\{key\}={\{value1\},\{value2\}}.}
\item \texttt{\{key\}} is equivalent to \texttt{\{key\}={\{value\},\{value\}}.}
\end{itemize}
\textit{Examples:} hmargin={1.5in,1in}, scale=0.8, body={7in,10in}.

\item \textbf{Triple-valued type}
takes three mandatory, comma-separated values in braces.
\begin{itemize}
\item \texttt{\{key\}={\{value1\},\{value2\},\{value3\}}}
\end{itemize}
Each value must be a dimension or null. When you give an empty value or \textquote{\texttt{*}}, it means null and leaves the appropriate value to the auto-completion mechanism. You need to specify at least one dimension, typically two dimensions. You can set nulls for all the values, but it makes no sense.
\textit{Examples:}
\begin{itemize}
\item hdivide={2cm,*\texttt{,1cm}}, vdivide={3cm,19cm, \texttt{,}}, divide={1in,*\texttt{,1in}}.
\end{itemize}
\end{enumerate}

\section{5 Option details}

This section describes all options available in \texttt{geometry}. Options with a dagger \texttt{†} are not available as arguments of \texttt{\newgeometry} (See Section 7).
5.1 Paper size

The options below set paper/media size and orientation.

\begin{itemize}
\item [\texttt{paper}] specifies the paper size by name. \texttt{paper=(paper-name)}. For convenience, you can specify
the paper name without \texttt{paper=}. For example, \texttt{a4paper} is equivalent to \texttt{paper=a4paper}.
\item [\texttt{a0paper}, \texttt{a1paper}, \texttt{a2paper}, \texttt{a3paper}, \texttt{a4paper}, \texttt{a5paper}, \texttt{a6paper},
\texttt{b0paper}, \texttt{b1paper}, \texttt{b2paper}, \texttt{b3paper}, \texttt{b4paper}, \texttt{b5paper}, \texttt{b6paper},
\texttt{c0paper}, \texttt{c1paper}, \texttt{c2paper}, \texttt{c3paper}, \texttt{c4paper}, \texttt{c5paper}, \texttt{c6paper},
\texttt{b0j}, \texttt{b1j}, \texttt{b2j}, \texttt{b3j}, \texttt{b4j}, \texttt{b5j}, \texttt{b6j},
\texttt{ansiapaper}, \texttt{ansibpaper}, \texttt{ansicpaper}, \texttt{ansidpaper}, \texttt{ansiepaper},
\texttt{letterpaper}, \texttt{executivepaper}, \texttt{legalpaper}]
\end{itemize}

\begin{itemize}
\item [\texttt{screen}] a special paper size with (W,H) = (225mm,180mm). For presentation with PC and
video projector, “screen,centering” with ‘slide’ documentclass would be useful.
\item [\texttt{paperwidth}] width of the paper. \texttt{paperwidth=\langle length\rangle}.
\item [\texttt{paperheight}] height of the paper. \texttt{paperheight=\langle length\rangle}.
\item [\texttt{papersize}] width and height of the paper. \texttt{papersize=\langle width\rangle,\langle height\rangle} or \texttt{papersize=\langle length\rangle}.
\item [\texttt{landscape}] switches the paper orientation to landscape mode.
\item [\texttt{portrait}] switches the paper orientation to portrait mode. This is equivalent to \texttt{landscape=false}.
\end{itemize}

The options for paper names (e.g., \texttt{a4paper}) and orientation (\texttt{portrait} and \texttt{landscape}) can be set
as document class options. For example, you can set \texttt{\documentclass[a4paper,landscape]{article}},
then \texttt{a4paper} and \texttt{landscape} are processed in \texttt{geometry} as well. This is also the case for \texttt{twoside}
and \texttt{twocolumn} (see also Section 5.5).

5.2 Layout size

You can specify the layout area with options described in this section regardless of the paper size. The options
would help to print the specified layout to a different sized paper. For example, with \texttt{a4paper}
and \texttt{layout=a5paper}, the package uses ‘A5’ layout to calculate margins on ‘A4’ paper. The layout size
defaults to the same as the paper. The options for the layout size are available in \texttt{\newgeometry}, so that
you can change the layout size in the middle of the document. The paper size itself can’t be changed
though. Figure 4 shows what the difference between \texttt{layout} and \texttt{paper} is.

\begin{itemize}
\item [\texttt{layout}] specifies the layout size by paper name. \texttt{layout=(paper-name)}. All the paper names
defined in \texttt{geometry} are available. See Section 5.1 for details.
\item [\texttt{layoutwidth}] width of the layout. \texttt{layoutwidth=\langle length\rangle}.
\item [\texttt{layoutheight}] height of the layout. \texttt{layoutheight=\langle length\rangle}.
\item [\texttt{layoutsize}] width and height of the layout. \texttt{layoutsize=\langle width\rangle,\langle height\rangle} or \texttt{layoutsize=\langle length\rangle}.
\item [\texttt{layoutoffset}] specifies the horizontal offset from the left edge of the paper. \texttt{layoutoffset=\langle length\rangle}.
\item [\texttt{layoutoffset}] specifies the vertical offset from the top edge of the paper. \texttt{layoutoffset=\langle length\rangle}.
\item [\texttt{layoutoffset}] specifies both horizontal and vertical offsets. \texttt{layoutoffset=\langle hoffset\rangle,\langle voffset\rangle} or \texttt{layoutsize=\langle length\rangle}.
\end{itemize}

5.3 Body size

The options specifying the size of total body are described in this section.

\begin{itemize}
\item [\texttt{hscale}] ratio of width of total body to \texttt{\paperwidth}. \texttt{hscale=\langle h-scale\rangle}, e.g., \texttt{hscale=0.8} is
equivalent to \texttt{width=0.8\paperwidth}. (0.7 by default)
\end{itemize}
Figure 4: The dimensions related to the layout size. Note that the layout size defaults to the same size as the paper, so you don’t have to specify layout-related options explicitly in most cases.

- **vscale**: ratio of height of *total body* to \text{paperheight}, e.g., vscale=(v-scale). (0.7 by default) vscale=0.9 is equivalent to height=0.9\text{paperheight}.
- **scale**: ratio of *total body* to the paper. scale={(h-scale),(v-scale)} or scale=(scale). (0.7 by default)
- **width | totalwidth**: width of *total body*. width=(length) or totalwidth=(length). This dimension defaults to textwidth, but if includemp is set to true, width ≥ textwidth because width includes the width of the marginal notes. If textwidth and width are specified at the same time, textwidth takes priority over width.
- **height | totalheight**: height of *total body*, excluding header and footer by default. If includehead or includefoot is set, height includes the head or foot of the page as well as textheight. height=(length) or totalheight=(length). If both textheight and height are specified, height will be ignored.
- **total**: width and height of *total body*. total={(width),(height)} or total=(length).
- **textwidth**: specifies \textwidth, the width of body (the text area). textwidth=(length).
- **textheight**: specifies \textheight, the height of body (the text area). textheight=(length).
- **text | body**: specifies both \textwidth and \textheight of the body of page. body={(width),(height)} or text=(length).
- **lines**: enables users to specify \textheight by the number of lines. lines=(integer).
- **includehead**: includes the head of the page, \headheight and \headsep, into *total body*. It is set to false by default. It is opposite to ignorehead. See Figure 2 and Figure 5.
- **includefoot**: includes the foot of the page, \footskip, into *total body*. It is opposite to ignorefoot. It is false by default. See Figure 2 and Figure 5.
- **includeheadfoot**: sets both includehead and includefoot to true, which is opposite to ignoreheadfoot. See Figure 2 and Figure 5.
- **includemp**: includes the margin notes, \marginparwidth and \marginparsep, into body when calculating horizontal calculation.
- **includeall**: sets both includeheadfoot and includemp to true. See Figure 5.
- **ignorehead**: disregards the head of the page, headheight and headsep, in determining vertical layout, but does not change those lengths. It is equivalent to includehead=false. It is set to true by default. See also includehead.
- **ignorefoot**: disregards the foot of page, foottskip, in determining vertical layout, but does not change that length. This option defaults to true. See also includefoot.
- **ignoreheadfoot**: sets both ignorehead and ignorefoot to true. See also includeheadfoot.
Figure 5: Sample layouts for total body with different switches. (a) includeheadfoot, (b) includeall, (c) includefoot and (d) includefoot,includemp. If reversemp is set to true, the location of the marginal notes are swapped on every page. Option twoside swaps both margins and marginal notes on verso pages. Note that the marginal note, if any, is printed despite ignoremp or includemp=false and overrun the page in some cases.

ignoremp disregards the marginal notes in determining the horizontal margins (defaults to true). If marginal notes overrun the page, the warning message will be displayed when verbose=true. See also includemp and Figure 5.

ignoreall sets both ignoreheadfoot and ignoremp to true. See also includeall.

heightrounded This option rounds \textheight to n-times (n: an integer) of \baselineskip plus \topskip to avoid “underfull vbox” in some cases. For example, if \textheight is 486pt with \baselineskip 12pt and \topskip 10pt, then

\[(39 \times 12pt + 10pt =) 478pt < 486pt < 490pt (= 40 \times 12pt + 10pt),\]

as a result \textheight is rounded to 490pt. heightrounded=false by default.

Figure 5 illustrates various layouts with different layout modes. The dimensions for a header and a footer can be controlled by nohead or nofoot mode, which sets each length to 0pt directly. On the other hand, options with the prefix ignore do not change the corresponding native dimensions.

The following options can specify body and margins simultaneously with three comma-separated values in braces.

hdivide horizontal partitions (left,width,right). \hdivide={⟨left margin⟩,⟨width⟩,⟨right margin⟩}. Note that you should not specify all of the three parameters. The best way of using this option is to specify two of three and leave the rest with null(nothing) or ‘*’. For example, when you set \hdivide={2cm,15cm, }, the margin from the right-side edge of page will be determined calculating \paperwidth-2cm-15cm.
vdivide vertical partitions \text{(top, height, bottom)}. vdivide=\{\langle top \text{ margin} \rangle, \langle height \rangle, \langle bottom \text{ margin} \rangle \}.

divide divide=\{A, B, C\} is interpreted as hdivide=\{A, B\} and vdivide=\{A, B, C\}.

5.4 Margin size

The options specifying the size of the margins are listed below.

left \mid lmargin \mid inner
left margin (for oneside) or inner margin (for twoside) of total body. In other words, the distance between the left (inner) edge of the paper and that of total body.
left=\langle length \rangle. inner has no special meaning, just an alias of left and lmargin.

right \mid rmargin \mid outer
right or outer margin of total body. right=\langle length \rangle.

top \mid tmargin

top margin of the page. top=\langle length \rangle. Note this option has nothing to do with the native dimension \topmargin.

bottom \mid bmargin
bottom margin of the page. bottom=\langle length \rangle.

hmargin left and right margin. hmargin=\{\langle left \text{ margin} \rangle, \langle right \text{ margin} \rangle \} or hmargin=\langle length \rangle.

vmargin top and bottom margin. vmargin=\{\langle top \text{ margin} \rangle, \langle bottom \text{ margin} \rangle \} or vmargin=\langle length \rangle.

margin margin=\{A, B\} is equivalent to hmargin=\{A, B\} and vmargin=\{A, B\}. margin=A is automatically expanded to hmargin=A and vmargin=A.

hmarginratio horizontal margin ratio of left (inner) to right (outer). The value of \langle ratio \rangle should be specified with colon-separated two values. Each value should be a positive integer less than 100 to prevent arithmetic overflow, e.g., 2:3 instead of 1:1.5. The default ratio is 1:1 for oneside, 2:3 for twoside.

vmarginratio vertical margin ratio of top to bottom. The default ratio is 2:3.

marginratio horizontal and vertical margin ratios. marginratio=\{\langle horizontal \text{ ratio} \rangle, \langle vertical \text{ ratio} \rangle \} or marginratio=\langle ratio \rangle.

hcentering sets auto-centering horizontally and is equivalent to hmarginratio=1:1. It is set to true by default for oneside. See also hmarginratio.

vcentering sets auto-centering vertically and is equivalent to vmarginratio=1:1. The default is false. See also vmarginratio.

centering sets auto-centering and is equivalent to marginratio=1:1. See also marginratio. The default is false. See also marginratio.

twoside switches on twoside mode with left and right margins swapped on verso pages. The option sets \texttt{\twoside} and \texttt{\mparswitch} switches. See also asymmetric.

asymmetric implements a twosided layout in which margins are not swapped on alternate pages (by setting \texttt{\oddsidemargin} to \texttt{\evensidemargin + bindingoffset} and in which the marginal notes stay always on the same side. This option can be used as an alternative to the twoside option. See also twoside.

bindingoffset removes a specified space from the lefthand-side of the page for oneside or the inner-side for twoside. bindingoffset=\langle length \rangle. This is useful if pages are bound by a press binding (glued, stitched, stapled . . . ). See Figure 6.

hdivide See description in Section 5.3.

vdivide See description in Section 5.3.

divide See description in Section 5.3.

5.5 Native dimensions

The options below overwrite \LaTeX\ native dimensions and switches for page layout (See the right-hand side in Figure 1).
Figure 6: The option \texttt{bindingoffset} adds the specified length to the inner margin. Note that \texttt{twoside} option swaps the horizontal margins and the marginal notes together with \texttt{bindingoffset} on even pages (see \textbf{b}), but \texttt{asymmetric} option suppresses the swap of the margins and marginal notes (but \texttt{bindingoffset} is still swapped).

\begin{itemize}
  \item \texttt{headheight} | \texttt{head} modifies \texttt{\headheight}, height of header. \texttt{headheight=\langle length \rangle} or \texttt{head=\langle length \rangle}.
  \item \texttt{headsep} modifies \texttt{\headsep}, separation between header and text (body). \texttt{headsep=\langle length \rangle}.
  \item \texttt{footskip} | \texttt{foot} modifies \texttt{\footskip}, distance separation between baseline of last line of text and baseline of footer. \texttt{footskip=\langle length \rangle} or \texttt{foot=\langle length \rangle}.
  \item \texttt{nohead} eliminates spaces for the head of the page, which is equivalent to both \texttt{\headheight=0pt} and \texttt{\headsep=0pt}.
  \item \texttt{nofoot} eliminates spaces for the foot of the page, which is equivalent to \texttt{\footskip=0pt}.
  \item \texttt{noheadfoot} equivalent to \texttt{nohead} and \texttt{nofoot}, which means that \texttt{\headheight}, \texttt{\headsep} and \texttt{\footskip} are all set to 0pt.
  \item \texttt{footnotesep} changes the dimension \texttt{\skip\footins}, separation between the bottom of text body and the top of footnote text.
  \item \texttt{marginparwidth} | \texttt{marginpar} modifies \texttt{\marginparwidth}, width of the marginal notes. \texttt{marginparwidth=\langle length \rangle}.
  \item \texttt{marginparsep} modifies \texttt{\marginparsep}, separation between body and marginal notes. \texttt{marginparsep=\langle length \rangle}.
  \item \texttt{nomarginpar} shrinks spaces for marginal notes to 0pt, which is equivalent to \texttt{\marginparwidth=0pt} and \texttt{\marginparsep=0pt}.
  \item \texttt{columnsep} modifies \texttt{\columnsep}, the separation between two columns in \texttt{twocolumn} mode.
  \item \texttt{offset} modifies \texttt{\offset}, \texttt{hoffset=\langle length \rangle}, \texttt{voffset=\langle length \rangle}.
  \item \texttt{offset} horizontal and vertical offset. \texttt{offset=\langle hoffset, voffset \rangle} or \texttt{offset=\langle length \rangle}.
  \item \texttt{twocolumn} sets \texttt{twocolumn} mode with \texttt{\@twocolumntrue}. \texttt{twocolumn=false} denotes onecolumn mode with \texttt{\@twocolumnfalse}. Instead of \texttt{twocolumn=false}, you can specify \texttt{onecolumn} (which defaults to \texttt{true})
  \item \texttt{onecolumn} works as \texttt{twocolumn=false}. On the other hand, \texttt{onecolumn=false} is equivalent to \texttt{twocolumn}.
  \item \texttt{twoside} sets both \texttt{\@twosidetrue} and \texttt{\@mparswitchtrue}. See Section 5.4.
  \item \texttt{textwidth} sets \texttt{\textwidth} directly. See Section 5.3.
  \item \texttt{textheight} sets \texttt{\textheight} directly. See Section 5.3.
  \item \texttt{reversemarginpar} makes the marginal notes appear in the left (inner) margin with \texttt{\@reversemarginpartrue}. The option doesn’t change \texttt{includemp} mode. It’s set \texttt{false} by default.
\end{itemize}
5.6 Drivers

The package supports drivers dvips, dvipdfm, pdftex, luatex, xetex and vtex. You can also set dvipdfm for dvipdfmx and xdvipdfmx. The options dvipdfmx and xdvipdfmx are also supported as aliases for the dvipdfm option. pdftex for pdflatex, and vtex for VTeX environment. The driver options are exclusive. The driver can be set by either driver=(driver name) or any of the drivers directly like pdftex. By default, geometry guesses the driver appropriate to the system in use. Therefore, you don’t have to set a driver in most cases. However, if you want to use dvipdfm, you should specify it explicitly.

† driver specifies the driver with driver=(driver name). dvips, dvipdfm, pdftex, luatex, xetex, auto and none are available as a driver name. The names except for auto and none can be specified directly with the name without driver=. driver=auto makes the auto-detection work whatever the previous setting is. driver=none disables the auto-detection and sets no driver, which may be useful when you want to let other package work out the driver setting. For example, if you want to use crop package with geometry, you should call \usepackage[driver=none]{geometry} before the crop package.

† dvips writes the paper size in dvi output with the \special macro. If you use dvips as a DVI-to-PS driver, for example, to print a document with \geometry{a3paper,landscape} on A3 paper in landscape orientation, you don’t need options “-t a3 -t landscape” to dvips.

† dvipdfm works like dvips except for landscape correction. You can set this option when using dvipdfmx and xdvipdfmx to process the dvi output.

† pdftex sets \pdfpagewidth and \pdfpageheight internally.

† luatex sets \pagewidth and \pageheight internally.

† xetex is the same as pdftex except for ignoring \pdforigin undefined in XQe\TeX{}. This option is introduced in the version 5. Note that ‘geometry.cfg’ in \TeX{} Live, which disables the auto-detection routine and sets pdftex, is no longer necessary, but has no problem even though it’s left undeleted. Instead of xetex, you can specify dvipdfm with XQe\TeX{} if you want to use specials of dvipdfm XQe\TeX{} supports.

† vtex sets dimensions \mediawidth and \mediaheight for \TeX{}. When this driver is selected (explicitly or automatically), geometry will auto-detect which output mode (DVI, PDF or PS) is selected in \TeX{}, and do proper settings for it.

If explicit driver setting is mismatched with the typesetting program in use, the default driver dvips would be selected.

5.7 Other options

The other useful options are described here.

† verbose displays the parameter results on the terminal. verbose=false (default) still puts them into the log file.

† reset sets back the layout dimensions and switches to the settings before geometry is loaded. Options given in geometry.cfg are also cleared. Note that this cannot reset pass and mag with truedimen. reset=false has no effect and cannot cancel the previous reset=(true) if any. For example, when you go

\documentclass[landscape]{article}
\usepackage[twoside,reset,left=2cm]{geometry}
\ExecuteOptions{scale=0.9}

with \ExecuteOptions{scale=0.9} in geometry.cfg, then as a result, landscape and left=2cm remain effective, and scale=0.9 and twoside are ineffective.

† mag sets magnification value (mag) and automatically modifies \voffset and \hoffset according to the magnification. mag=(value). Note that (value) should be an integer value with 1000 as a normal size. For example, mag=1414 with a4paper provides an enlarged print fitting in a3paper, which is 1.414 (=√2) times larger than a4paper. Font enlargement needs extra disk space. Note that setting mag should precede any other settings with ‘true’ dimensions, such as 1.5truein, 2truecm and so on. See also truedimen option.
changes all internal explicit dimension values into true dimensions, e.g., 1in is changed to 1truein. Typically this option will be used together with mag option. Note that this is ineffective against externally specified dimensions. For example, when you set \texttt{mag=1440, margin=10pt, truedimen}, margins are not ‘true’ but magnified. If you want to set exact margins, you should set like \texttt{mag=1440, margin=10truept, truedimen} instead.

\textit{pass} disables all of the geometry options and calculations except verbose and showframe. It is order-independent and can be used for checking out the page layout of the documentclass, other packages and manual settings without geometry.

\textit{showframe} shows visible frames for the text area and page, and the lines for the head and foot on the first page.

\textit{showcrop} prints crop marks at each corner of user-specified layout area.

\section{Processing options}

\subsection{Order of loading}

If there’s geometry.cfg somewhere \TeX{} can find it, geometry loads it first. For example, in geometry.cfg you may write \texttt{\ExecuteOptions{a4paper}}, which specifies A4 paper as the default paper. Basically you can use all the options defined in geometry with \texttt{\ExecuteOptions{}}.

The order of loading in the preamble of your document is as follows:

1. geometry.cfg if it exists.
2. Options specified with \texttt{\documentclass[⟨options⟩]{...}}.
3. Options specified with \texttt{\usepackage[⟨options⟩]{geometry}}
4. Options specified with \texttt{\geometry{⟨options⟩}}, which can be called multiple times. (reset option will cancel the specified options ever given in \texttt{\usepackage{geometry}} or \texttt{\geometry}.)

\subsection{Order of options}

The specification of geometry options is order-independent, and overwrites the previous one for the same setting. For example,

\texttt{[left=2cm, right=3cm]} is equivalent to \texttt{[right=3cm, left=2cm]}.

The options called multiple times overwrite the previous settings. For example,

\texttt{[verbose=true, verbose=false]} results in \texttt{verbose=false}.

\texttt{[hmargin={3cm,2cm}, left=1cm]} is the same as \texttt{hmargin={1cm,2cm}}, where the left (or inner) margin is overwritten by \texttt{left=1cm}.

\texttt{reset} and \texttt{mag} are exceptions. The \texttt{reset} option removes all the geometry options (except pass) before it. If you set

\begin{verbatim}
\documentclass[landscape]{article}
\usepackage[margin=1cm, twoside]{geometry}
\geometry{a5paper, reset, left=2cm}
\end{verbatim}

then margin=1cm, twoside and a5paper are removed, and is eventually equivalent to

\begin{verbatim}
\documentclass[landscape]{article}
\usepackage[left=2cm]{geometry}
\end{verbatim}

The \texttt{mag} option should be set in advance of any other settings with ‘true’ length, such as \texttt{left=1.5truecm, width=5truein} and so on. The \texttt{mag} primitive can be set before this package is called.
6.3 Priority

There are several ways to set dimensions of the \textit{body}: scale, total, text and lines. The \texttt{geometry} package gives higher priority to the more concrete specification. Here is the priority rule for \textit{body}.

\[
\text{priority: low} \rightarrow \text{high} \\
\begin{cases}
  \text{hscale} \\
  \text{vscale} \\
  \text{scale}
\end{cases} <
\begin{cases}
  \text{width} \\
  \text{height} \\
  \text{total}
\end{cases} <
\begin{cases}
  \text{textwidth} \\
  \text{textheight} \\
  \text{text}
\end{cases} < \text{lines}.
\]

For example,

\begin{verbatim}
\usepackage[hscale=0.8, textwidth=7in, width=18cm]{geometry}
\end{verbatim}

is the same as \begin{verbatim}\usepackage[textwidth=7in]{geometry}\end{verbatim}. Another example:

\begin{verbatim}
\usepackage[lines=30, scale=0.8, text=7in]{geometry}
\end{verbatim}

results in \begin{verbatim}[lines=30, textwidth=7in]\end{verbatim}.

6.4 Defaults

This section sums up the default settings for the auto-completion described later.

The default vertical margin ratio is $\frac{2}{3}$, namely,

\[
\text{top} : \text{bottom} = 2 : 3 \quad \text{default.} \tag{6}
\]

As for the horizontal margin ratio, the default value depends on whether the document is onesided or twosided,

\[
\text{left (inner)} : \text{right (outer)} = \begin{cases} 1 : 1 & \text{default for oneside}, \\ 2 : 3 & \text{default for twoside}. \end{cases} \tag{7}
\]

Obviously the default horizontal margin ratio for oneside is ‘centering’.

The \texttt{geometry} package has the following default setting for \textit{onesided} documents:

\begin{itemize}
  \item \texttt{scale}=0.7 (\textit{body} is $0.7 \times \text{paper}$)
  \item \texttt{marginratio}=(1:1, 2:3) (1:1 for horizontal and 2:3 for vertical margins)
  \item \texttt{ignoreall} (the header, footer, marginal notes are excluded when calculating the size of \textit{body}.)
\end{itemize}

For \textit{twosided} document with \texttt{twoside} option, the default setting is the same as \textit{onesided} except that the horizontal margin ratio is set to 2:3 as well.

Additional options overwrite the previous specified dimensions.

6.5 Auto-completion

Figure 7 shows schematically how many specification patterns exist and how to solve the ambiguity of the specifications. Each axis shows the numbers of lengths explicitly specified for body and margins. \texttt{S(m,b)} presents the specification with a set of numbers (\texttt{margin, body}) = (m, b).

For example, the specification \texttt{width=14cm, left=3cm} is categorized into \texttt{S(1,1)}, which is an adequate specification. If you add \texttt{right=4cm}, it would be in \texttt{S(2,1)} and overspecified. If only \texttt{width=14cm} is given, it’s in \texttt{S(0,1)}, underspecified.

The \texttt{geometry} package has the auto-completion mechanism, in which if the layout parameters are underspecified or overspecified, \texttt{geometry} works out the ambiguity using the defaults and other relations. Here are the specifications and the completion rules.

\[ \texttt{S(0,0)} \] Nothing is specified. The \texttt{geometry} package sets \textit{body} with the default \texttt{scale} (= 0.7).

For example, \texttt{width} is set to be $0.7 \times \texttt{layoutwidth}$. Note that by default \texttt{layoutwidth} and \texttt{layoutheight} will be equal to \texttt{\paperwidth} and \texttt{\paperheight} respectively. Thus \texttt{S(0,0)} goes to \texttt{S(0,1)}. See \texttt{S(0,1)}.
**Figure 7:** Specifications $S(0,0)$ to $S(2,1)$ and the completion rules (arrows). Column and row numbers denote the number of explicitly specified lengths for margin and body respectively. $S(m,b)$ denote a specification with a set of the numbers $(\text{margin}, \text{body}) = (m, b)$.

**S(0,1)** Only body is specified, such as width=7in, lines=20, body={20cm, 24cm}, scale=0.9 and so forth. Then geometry sets margins with the margin ratio. If the margin ratio is not specified, the default is used. The default vertical margin ratio is defined as

$$ \text{top} : \text{bottom} = 2 : 3 \quad \text{default.} \quad (8) $$

As for the horizontal margin ratio, the default value depends on whether the document is onesided or twosided,

$$ \text{left} (\text{inner}) : \text{right} (\text{outer}) = \begin{cases} 1 : 1 & \text{default for oneside,} \\ 2 : 3 & \text{default for twoside.} \end{cases} \quad (9) $$

For example, if height=22cm is specified on A4 paper, geometry calculates top margin as follows:

$$ \text{top} = (\text{layoutheight} - \text{height}) \times 2/5 $$
$$ = (29.7 - 22) \times 2/5 = 3.08 \text{cm} \quad (10) $$

Thus top margin and body height have been determined, the specification for the vertical goes to $S(1,1)$ and all the parameters can be solved.

**S(1,0)** Only one margin is specified, such as bottom=2cm, left=1in, top=3cm, and so forth.

- **If the margin ratio is not specified,** geometry sets body with the default scale ($= 0.7$). For example, if top=2.4cm is specified, geometry sets

  $$ \text{height} = 0.7 \times \text{layoutheight} \quad (= 0.7 \backslash \text{paperheight} \text{ by default}), $$

  then $S(1,0)$ goes to $S(1,1)$, in which bottom is calculated with

  $$ \text{layoutheight} - (\text{height} + \text{top}) $$

  and results in 6.51cm on A4 paper if the layout size is equal to the paper size.

- **If the margin ratio is specified,** such as hmarginratio={1:2}, vratio={3:4} and so forth, geometry sets the other margin with the specified margin ratio. For example, if a set of options “top=2.4cm, vratio={3:4}” is specified, geometry sets bottom to be 3.2cm calculating

  $$ \text{bottom} = \text{top}/3 \times 4 = 3.2 \text{cm} $$

  Thus $S(1,0)$ goes to $S(2,0)$.

Note that the version 4 or earlier used to set the other margin with the margin ratio. In the version 5, therefore, with the same specification, the result will be different from the one in the version 4. For example, if only top=2.4cm is specified, you got bottom=2.4cm in the version 4 or earlier, but you will get bottom=6.51cm in the version 5.
The \textit{body} and two \textit{margins} are all specified, such as \texttt{vdivide={1in,8in,1.5in}}, \texttt{“left=3cm,width=13cm,right=4cm”} and so forth. Since \texttt{geometry} basically gives priority to \textit{margins} if dimensions are overspecified, \texttt{geometry} forgets and resets \textit{body}. For example, if you specify

\begin{verbatim}
\usepackage[a4paper,left=3cm,width=13cm,right=4cm]{geometry},
\end{verbatim}

\texttt{width} is reset to be 14cm because the width of a A4 paper is 21cm long.

7 Changing layout mid-document

The version 5 provides the new commands \texttt{\newgeometry{⋯}} and \texttt{\restoregeometry}, which allow you to change page dimensions in the middle of the document. Unlike \texttt{\geometry} in the preamble, \texttt{\newgeometry} is available only after \texttt{\begin{document}}, resets all the options ever specified except for the papersize-related options: \texttt{landscape}, \texttt{portrait}, and paper size options (such as \texttt{papersize}, \texttt{paper=a4paper} and so forth), which can’t be changed with \texttt{\newgeometry}.

The command \texttt{\restoregeometry} restores the page layout specified in the preamble (before \texttt{\begin{document}}) with the options to \texttt{\usepackage{geometry}} and \texttt{\geometry}.

Note that both \texttt{\newgeometry} and \texttt{\restoregeometry} insert \texttt{\clearpage} where they are called.

Below is an example of changing layout mid-document. The layout L1 specified with \texttt{hmargin=3cm} (\texttt{left} and \texttt{right} margins are 3cm long) is changed to L2 with \texttt{left=3cm, right=1cm} and \texttt{bottom=0.1cm}. The layout L1 is restored with \texttt{\restoregeometry}.

\begin{verbatim}
\usepackage[hmargin=3cm]{geometry}
\begin{document}
  Layout L1
  \newgeometry{left=3cm,right=1cm,bottom=0.1cm}
    Layout L2 (new)
  \restoregeometry
    Layout L1 (restored)
  \newgeometry{margin=1cm,includefoot}
    Layout L3 (new)
\end{document}
\end{verbatim}

A set of commands \texttt{\savegeometry{⟨name⟩}} and \texttt{\loadgeometry{⟨name⟩}} is handy if you want to reuse more different layouts in your document. For example,

\begin{verbatim}
\usepackage[hmargin=3cm]{geometry}
\begin{document}
  L1
  \newgeometry{left=3cm,right=1cm,bottom=0.1cm}
  \savegeometry{L2}
    L2 (new, saved)
\end{document}
\end{verbatim}
8 Examples

1. A onesided page layout with the text area centered in the paper. The examples below have the same result because the horizontal margin ratio is set 1:1 for oneside by default.
   - centering
   - marginratio=1:1
   - vcentering

2. A twosided page layout with the inside offset for binding set to 1cm.
   - twoside, bindingoffset=1cm

   In this case, textwidth is shorter than that of the default twosided document by \[0.7 \times 1 \text{cm} (= 0.7 \text{cm})\] because the default width of body is set with scale=0.7, which means \[\text{width} = 0.7 \times \text{layoutwidth} (= 0.7 \times \text{paperwidth} \text{ by default})\].

3. A layout with the left, right, and top margin 3cm, 2cm and 2.5in respectively, with textheight of 40 lines, and with the head and foot of the page included in total body. The two examples below have the same result.
   - left=3cm, right=2cm, lines=40, top=2.5in, includeheadfoot
   - hmargin={3cm,2cm}, tmargin=2.5in, lines=40, includeheadfoot

4. A layout with the height of total body 10in, the bottom margin 2cm, and the default width. The top margin will be calculated automatically. Each solution below results in the same page layout.
   - vdivide={*, 10in, 2cm}
   - bmargin=2cm, height=10in
   - bottom=2cm, textheight=10in

   Note that dimensions for head and foot are excluded from height of total body. An additional includefoot makes \footskip included in totalheight. Therefore, in the two cases below, textheight in the former layout is shorter than the latter (with 10in exactly) by \footskip. In other words, height = textheight + footskip when includefoot=true in this case.
   - bmargin=2cm, height=10in, includefoot
   - bottom=2cm, textheight=10in, includefoot

5. A layout with textwidth and textheight 90% of the paper and with body centered. Each solution below results in the same page layout as long as layoutwidth and layoutheight are not modified from the default.
   - scale=0.9, centering
   - text={.9\paperwidth,.9\paperheight}, ratio=1:1
   - width=0.9\paperwidth, vmargin=.05\paperheight, marginratio=1:1
   - hdivide={*,0.9\paperwidth,*}, vdivide={*,0.9\paperheight,*} (as for onesided documents)
   - margin={0.05\paperwidth,0.05\paperheight}

   You can add heightrounded to avoid an “underfull vbox warning” like

   Underfull \vbox (badness 10000) has occurred while \output is active.
See Section 5.3 for the detailed description about \texttt{heightrounded}.

6. A layout with the width of marginal notes set to 3 cm and included in the width of \textit{total body}. The following examples are the same.

   \begin{itemize}
   \item marginparwidth=3cm, includemp
   \item marginpar=3cm, ignoremp=false
   \end{itemize}

7. A layout where \textit{body} occupies the whole paper with A5 paper in landscape. The following examples are the same.

   \begin{itemize}
   \item a5paper, landscape, scale=1.0
   \item landscape=TRUE, paper=a5paper, margin=0pt
   \end{itemize}

8. A screen size layout appropriate for presentation with PC and video projector.

   \begin{verbatim}
   \documentclass{slide}
   \usepackage[screen, margin=0.8in]{geometry}
   ...
   \begin{slide}
   ...
   \end{slide}
   \end{verbatim}

9. A layout with fonts and spaces both enlarged from A4 to A3. In the case below, the resulting paper size is A3.

   \begin{itemize}
   \item a4paper, mag=1414.
   \end{itemize}

   If you want to have a layout with two times bigger fonts, but without changing paper size, you can type

   \begin{itemize}
   \item letterpaper, mag=2000, truedimen.
   \end{itemize}

   You can add \texttt{dvips} option, that is useful to preview it with proper paper size by \texttt{dviout} or \texttt{xdvi}.

10. Changing the layout of the first page and leaving the others as default before loading \texttt{geometry}. Use \texttt{pass} option, \texttt{newgeometry} and \texttt{restoregeometry}.

   \begin{verbatim}
   \documentclass{book}
   \usepackage[pass]{geometry}
   \begin{document}
   \newgeometry{margin=1cm}% changes the first page dimensions.
   \begin{document}
   Page 1
   \restoregeometry % restores the original 'book' layout.
   Page 2 and more
   \end{document}
   \end{document}
   \end{verbatim}

11. A complex page layout.

   \begin{verbatim}
   \usepackage[a5paper, landscape, twocolumn, twoside, 
   left=2cm, hmarginratio=2:1, includemp, marginparwidth=43pt, 
   bottom=1cm, foot=-.7cm, includefoot, textheight=11cm, heightrounded, 
   columnsep=1cm, dvips, verbose]{geometry}
   \end{verbatim}

   Try typesetting it and checking out the result yourself. :-)

9 Known problems

   \begin{itemize}
   \item With \texttt{mag} $\neq$ 1000 and \texttt{truedimen}, \texttt{paperwidth} and \texttt{paperheight} shown in verbose mode are different from the real size of the resulted PDF. The PDF itself is correct anyway.
   \item With \texttt{mag} $\neq$ 1000, \texttt{no truedimen} and \texttt{hyperref}, \texttt{hyperref} should be loaded before \texttt{geometry}. Otherwise the resulted PDF size will become wrong.
   \item With \texttt{crop} package and \texttt{mag} $\neq$ 1000, \texttt{center} option of \texttt{crop} doesn’t work well.
   \end{itemize}

\Gm@Dvratio

\Gm@cnth The counters for horizontal and vertical partitioning patterns.
\Gm@cntv
\c@Gm@tempcnt
\Gm@bindingoffset The binding offset for the inner margin.
\Gm@wd@mp Correction lengths for \textwidth, \oddsidemargin and \evensidemargin in includemp mode.
\Gm@odd@mp
\Gm@even@mp
\Gm@layoutwidth The dimensions for the layout area.
\Gm@layoutheight
\Gm@layouthoffset
\Gm@layoutvoffset
\Gm@dimlist The token in which L\LaTeX native dimensions can be stored.
\Gm@warning The macro to print warning messages.
\ifGm@preamble The macro executes the option given as an argument only if it’s specified in the preamble, as the options of \usepackage and/or the argument of \geometry. Otherwise, the macro would print the warning message and ignores the option setting.
\Gm@Dhratio The default values for the horizontal and vertical marginratio are defined. \Gm@Dhratiotwo denotes the default value of horizontal marginratio for twoside page layout with left and right margins swapped on verso pages, which is set by twoside.
\Gm@Dvratio

\Gm@Dhratio(1:1) = left:right default for oneside
\Gm@Dhratiotwo(2:3) = inner:outer default for twoside.
\Gm@Dvratio(2:3) = top:bottom default
The default values for the horizontal and vertical scale are defined with 0.7.

The driver names.

The macros for true and false.

These macros keep original paper (media) size intact.

The macro saves the specified length to \Gm@restore.

The macro saves the specified boolean to \Gm@restore.

The initialization for \Gm@restore.

The definition of the macro saving the real lengths \LaTeX options.
The macro initializes the parameters for layout in \newgeometry.

503 \define@key{Gm}{lmargin}{\Gm@branch{#1}{lmargin}{tmargin}}%
504 \Gm@branch{#1}{rmargin}{bmargin}
Options specifying the margin ratios.

`hmarginratio`  
`vmarginratio`  
`marginratio`  
`hratio`  
`vratio`  
`ratio`  

Useful shorthands to place *body* centered.

`hcentering`  
`vcentering`  
`centering`  

If `twoside=true`, \@twoside and \@mparswitch is set to true.

`asymmetric`  
asymmetric sets \@mparswitchfalse and \@twosidetrue A asymmetric=false has no effect.

The macro adds the specified space to the inner margin.

The direct settings of *head* and/or *foot* dimensions.

They are only shorthands to set *head* and/or *foot* to be Opt.

They directly set native dimensions \marginparwidth and \marginparsep.

The macro is a shorthand for \marginparwidth=0pt and \marginparsep=0pt.

The option sets a native dimension \columnsep.

The former two options set native dimensions \hoffset and \voffset. offset can set both of them with the same value.
The geometry package supports dvips, dvipdfm, pdflatex, luatex and vtex. dvipdfm works like dvips.

The verbose mode.

The option cancels all the options specified before reset, except pass. mag (≠ 1000) with truedimen cannot be also reset.

If resetpaper is set to true, the paper size redefined in the package is discarded and the original one is restored. This option may be useful to print nonstandard sized documents with normal printers and papers.
If `true` is set to `true`, all of the internal explicit dimensions is changed to `true` dimensions, e.g., `1in` is changed to `1truein`.

The option makes all the options specified ineffective except verbose switch.

The showframe option prints page frames to help you understand what the resulting layout is like.

The showcrop option prints crop marks at each corner of the layout area.

The macro stores paper dimensions. This macro should be called after \`\ProcessOptionsKV\`{Gm}. If the landscape option in \`\documentclass\` is specified, the class immediately swaps the paper dimensions.

The macro checks if paper width/height is larger than 0pt, which is used in \`\Gm@process\`. The paper dimensions can be swapped when paper orientation is changed over by landscape and portrait options.

The macro checks whether or not the marginpars overrun the page.
The macro sets marginpar correction when includemarg is set, which is used in \Gm@process. The variables \Gm@wd@mp, \Gm@odd@mp and \Gm@even@mp are set here. Note that \Gm@even@mp should be used only for twoside layout.

\def\Gm@adjustmp{%

  \ifvtex
    \Gm@setdriver{vtex}%
  \fi
\fi

\ifxetex
  \ifxetex
    \Gm@setdriver{xetex}%
  \fi
\fi

When the driver option is set by the user, check if it is valid or not.

```latex
\else
  \ifGm@driver\Gm@xetex\%
    \ifxetex\else
      \Gm@warning{Wrong driver setting: 'xetex'; trying 'pdftex' driver}%
      \Gm@setdriver{pdftex}
    \fi
  \fi
  \ifGm@driver\Gm@vtex\%
    \ifvtex\else
      \Gm@warning{Wrong driver setting: 'vtex'; trying 'dvips' driver}%
      \Gm@setdriver{dvips}
    \fi
  \fi
\fi
```

\Gm@showparams

Prints the resulted parameters and dimensions to STDOUT if \texttt{verbose} is true. \texttt{\Gm@width} and \texttt{\Gm@height} are expanded to get the real size.

```latex
\def\Gm@showparams#1{%\ifGm@verbose\expandafter\typeout\else\expandafter\wlog\fi{%\Gm@logcontent{#1}}%}
```

\Gm@showdim

The content of geometry parameters and native dimensions for the page layout.

```latex
\def\Gm@showdim#1{\string#1=\the#1^^J}%
```

\Gm@showbool

The content of geometry parameters and native dimensions for the page layout.

```latex
\def\Gm@showbool#1{\@nameuse{ifGm@#1}#1\space\fi}%
```

\Gm@logcontent

The content of geometry parameters and native dimensions for the page layout.

```latex
\def\Gm@logcontent#1{\*geometry* verbose mode - \[ #1 \] result:^^J%\ifGm@pass * pass: disregarded the geometry package!^^J%\else
* driver: \if\Gm@driver\Gm@xetex<none>\else\Gm@driver\fi\%^J%* paper: \if\Gm@paper\undefined\default\else\Gm@paper\fi\%^J%* layout: \if\Gm@layout<custom>\else<same size as paper>\fi\%^J%\if\Gm@layout

\fi
\fi

Checking the driver options.
\Gm@detectdriver
If \texttt{xetex} and \texttt{\pdfpagewidth} is defined, \texttt{\pdfpagewidth} and \texttt{\pdfpageheight} would be set.
\if\Gm@driver\Gm@xetex
 \ifundefined{pdfpagewidth}{\%  
 \setlength\pdfpagewidth{\Gm@pw}%
 \setlength\pdfpageheight{\Gm@ph}%
\fi
\fi
If \texttt{pdftex} is set to \texttt{true}, pdf-commands are set properly. To avoid \texttt{pdftex} magnification problem, \texttt{\pdfhorigin} and \texttt{\pdfvorigin} are adjusted for \texttt{\mag}.

If \texttt{luatex} is set to \texttt{true}, pdf-commands are set properly. To avoid \texttt{luatex} magnification problem, \texttt{\horigin} and \texttt{\vorigin} are adjusted for \texttt{\mag}.

With \texttt{VTX} environment, \texttt{VTX} variables are set here.

If \texttt{dvips} or \texttt{dvipdfm} is specified, paper size is embedded in dvi file with \texttt{\special}. For dvips, a landscape correction is added because a landscape document converted by dvips is upside-down in PostScript viewers.
If dvipdfm is specified and atbegshi package in ‘oberdiek’ bundle is loaded, \AtBeginShipoutFirst is used instead of \AtBeginDvi for compatibility with hyperref and dvipdfm program.

Page frames are shipped out when showframe=true, cropmarks for showcrop=true on each page. The atbegshi package is used for overloading \shipout.

The layout dimensions for \restoregeometry are saved at the end of the \AtBeginDocument.

\geometry The macro \geometry can be called multiple times in the preamble (before \begin{document}).

\newgeometry The macro \newgeometry, \restoregeometry and \loadgeometry, changes the layout in the middle of the document.

\newgeometry The macro \newgeometry, which can be called from \newgeometry, \restoregeometry and \loadgeometry, changes the layout in the middle of the document.
The macro restores the resulting layout specified in the preamble, namely the first-page layout right after `\begin{document}`.

The macro saves the layout with the name specified with the argument. The saved layout can be loaded with `\loadgeometry{⟨name⟩}`. If the name is not found, the macro would warn it and do nothing for the layout.

In the configuration file `geometry.cfg`, one can use `\ExecuteOptions` to set the site or user default settings.

Here is a sample document for the `geometry` package.
% \usepackage[width=10cm, vscale=.7]{geometry}
% \usepackage[margin=1cm, papersize={12cm,19cm}, resetpaper]{geometry}
