30 December 2018, v1.01

Abstract

**mathfixs** is a **LATEX** 2ε package to fix some odd behaviour in math mode such as spacing around fractions and roots, math symbols within bold text as well as capital Greek letters. It also adds some related macros.

B Implementation

1 Introduction

Undoubtedly, **TEX** and **LATEX** are excellent at producing visually appealing mathematical expressions. However, some commonly used macros produce output which sometimes appears unbalanced under certain conditions. Depending on the level of sophistication, such artefacts are typically either ignored or fixed by some manual adjustments wherever they appear. This package addresses some of the issues encountered commonly (by the author),
and provides fixes or additional macros to handle such situations. At present the package is mainly concerned with:

- spacing of fractions, roots and symbols
- alternative versions of fractions
- representation of (capital) Greek letters
- math symbols within bold text

Additional fixes and features may be added to the package in later versions. All of these features can be selected and customised to some extent to accommodate for the desired style.

## 2 Usage

To use the package `mathfixs` add the command

```
\usepackage{mathfixs}
```

to the preamble of your \LaTeX document. Furthermore you must select the desired features explicitly as described below, otherwise the package will have no effect. This is to avoid having to agree on all the provided features and to allow for forward compatibility: the package should remain open for future extensions which may modify the default behaviour in an unintended fashion.

### 2.1 Package Features

Features and options can be selected by the commands:

```
\ProvideMathFix{opts}
```

or

```
\PassOptionsToPackage{opts}{mathfixs}
```

\PassOptionsToPackage must be used before \usepackage; \ProvideMathFix must be used afterwards. Note that if \ProvideMathFix is invoked within a block, its definitions are valid only locally within the block. \textit{opts} is a comma-separated list of features or options. The available features and options are described below.

### 2.2 Fractions

The package offers some improvements for the spacing of fractions as well as definitions to typeset small rational numbers.

---

**Feature frac.** In many situations, \LaTeX typesets fractions with an insufficient amount of surrounding space. For example, the space between two consecutive fractions almost make them appear as a single one:

\[
x\frac{a+b}{c+d}\frac{e}{f}.
\]

→

\[
x\frac{a+b}{c+d}\frac{e}{f}.
\]

Also the space towards other symbols and punctuation marks arguably is too small. To make expressions more legible, sequences of fractions are often coded with various custom spaces (‘\,’ ‘:\,’ ‘;’ ‘\,’ ‘~’, etc.) inserted, e.g.
This looks better, but requires a lot of intervention and depends very much on personal conventions.

The underlying technical reason for the shortcoming in spacing around fractions is that the latter are defined to have the math class of ordinary objects (\texttt{\mathord}) which results in no surrounding space. A simple resolution is to assign the math class of inner objects (\texttt{\mathinner}) to fractions as described in the \TeX{}book, e.g.

\begin{align*}
\frac{\frac{a+b}{c+d}}{\frac{e}{f}}
\end{align*}

Inner objects behave almost like ordinary objects, but some space is added between them and other inner or ordinary objects, e.g.:

\begin{align*}
x \frac{a+b}{c+d} \frac{e}{f}
\end{align*}

Importantly, no space is added between inner objects and the ends of the math expression or subexpression in parentheses. Also, no space is generated in the script styles (\texttt{\scriptscriptstyle}).

\texttt{\frac} The feature \texttt{\frac} redefines the macro \texttt{\frac} such that all fractions have the inner math class producing some surrounding space in selected situations, e.g.:

\begin{align*}
x \frac{a+b}{c+d} \frac{e}{f}
\end{align*}

This makes adding custom space around fractions unnecessary in almost all situations, and leads to a rather uniform appearance without further adjustments.

\texttt{\genfrac} The macro \texttt{\genfrac} of the package \texttt{amsmath} is modified suitably when the latter is loaded. This also affects the macros \texttt{\dfrac} and \texttt{\tfrac} for fractions in styles \texttt{\displaystyle} and \texttt{\textstyle}, respectively. For \texttt{\genfrac} fractions with delimiters, the inner math class is not applied because the default math class is appropriate.

Note that when the \texttt{\frac} feature is used, spaces around fractions can be eliminated by using:

\begin{align*}
\texttt{\mathord{\frac{\{num\}}{\{denom\}}}}
\end{align*}

or simply (a block enclosed by braces \{\ldots\} is considered an object with ordinary math class):

\begin{align*}
\{\texttt{\frac{\{num\}}{\{denom\}}}\}
\end{align*}

Furthermore, note that unlike the original macro \texttt{\frac}, the redefined macro must be enclosed in a block when passed as an argument. For example, \texttt{x^{\frac{1}{2}}} produces an error and must be written as \texttt{x^{\{\frac{1}{2}\}}}.

\texttt{fracclass} The option \texttt{fracclass=class} can be used to customise the math class of fractions to any desired command \texttt{class} accepting the expression for the fraction as its single parameter. Likewise, the option \texttt{fracdelimclass=class} customises the math class of fractions with delimiters generated by \texttt{\genfrac} such as \texttt{[d|t|binom]}.

\texttt{rfrac} \textbf{Feature \texttt{rfrac}.} Rational numbers as coefficients to some simple terms often stick out visually from displayed math expressions, e.g.:

\begin{align*}
\frac{1}{2}x^2 + \frac{1}{6}y^3 + \frac{1}{4}x^2y^2
\end{align*}
Arguably, typesetting such fractions in text style has a more uniform appearance:

\[ \frac{1}{2}x^2 + \frac{1}{2}y^3 + \frac{1}{2}x^2y^2 \]

\textbf{rfrac} The feature \texttt{rfrac} defines the macro \texttt{\rfrac} to typeset a fraction in text style or smaller. It is similar to \texttt{\rfrac} of the package \texttt{amsmath}, but it will not choose text style when in the script styles and it will not produce surrounding space when the feature \texttt{frac} is used. The optional argument \texttt{rfrac=\{\cmd\}} specifies an alternative command name \texttt{\cmd} for \texttt{\rfrac}.

\textbf{vfrac} \textbf{Feature vfrac.} Common or vulgar fractions such as \(\frac{1}{2}\) can be typeset in a simple fashion as a superscript numerator followed by a slash and a subscript denominator. The spacing around the slash should be reduced to join the expression. The package provides this representation as the feature \texttt{vfrac} defining the macro \texttt{\vfrac}. It is similar to \texttt{\nicefrac} of the package \texttt{nicefrac} or the more advanced implementation \texttt{\sfrac} of the package \texttt{xfrac}. As vulgar fractions are often (mainly) used within plain text, the macro \texttt{\vfrac} also works in text mode. The optional argument \texttt{vfrac=\{\cmd\}} specifies an alternative command name \texttt{\cmd} for \texttt{\vfrac}.

\texttt{vfracclass} The option \texttt{vfracclass=class} can be used to customise the math class of the vulgar fraction.

\texttt{vfracskippre} The options \texttt{vfracskippre=\muskip} and \texttt{vfracskippost=\muskip} define the (negative) skip around the slash (must be given in math units \texttt{mu}).

\textbf{2.3 Roots} \textbf{Feature root.} The package provides an alternative mechanism for the placement of the exponent next to the radical. It first measures the extents of the exponent and the radical sign and then places them accordingly. It also adds some space at the end of the radicand. The refined definition produces the following representation without further spacing adjustments

\[ y\sqrt{xz}, \quad y\sqrt{xz}, \quad y\sqrt{xz}, \quad y\sqrt{xz}, \quad y\sqrt{xz}, \quad \sqrt[123]{xz} \]

They work best if no exponent is specified or if the exponent is a single numerical digit. The spacing is slightly different if the exponent is \(n\) or \(i\).

\texttt{rootclass} The option \texttt{rootclass=class} can be used to customise the math class of the vulgar fraction.

\texttt{rootskipend} The option \texttt{rootskipend=\muskip} defines the additional skip at the end of the radicand within the radical (must be given in math units \texttt{mu}). The options \texttt{rootskippre=\muskip} and \texttt{rootskippost=\muskip} define additional skip around the radical.

\texttt{rootclose} The option \texttt{rootclose} adds a closing mark to the end of the top bar of radicals:

\[ \sqrt{a} \]

The optional argument \texttt{rootclose=\{\height\}} specifies the starting height with a default value of 0.8.

\textbf{2.4 Space Representing Multiplication Signs} Mathematical expressions regularly omit explicit multiplication signs between factors, e.g. \(x^2yz\). All is well unless some of the factors are compound expressions such as \(\Delta x\) or differentials \(dx\) (or \(d\!x\)) where additional space is typically inserted by commands like \texttt{\,}. 

4
A simple method to declare (or define) compound expressions with a suitable amount of surrounding space is to encapsulate them in a `\mathinner` block, e.g.

\[ 12c\mathinner{\Delta x}\mathinner{\Delta y}z \rightarrow 12c \Delta x \Delta y \]
\[ \int x\mathinner{dx} \rightarrow \int x \, dx \]

Importantly, `\mathinner` will not add any space at the ends of an expression (or a subexpression in parentheses).

**Feature multskip.** Furthermore, the package provides the feature `multskip` to encode a space representing an omitted multiplication sign by the short command `\`, e.g.:

\[ 12c\.\Delta x\.\Delta y\.z \text{ or } \int x\.dx \]

The macro `\` produces some amount of space in math mode (while retaining its original definition as an accent in text mode) and by default it is equivalent to `\`,. However, the macro `\` is intended to describe this space unambiguously as a multiplication sign. In particular, the amount of space can be configured by the option `multskip=muskip` (given in math units `mu`), or the command could be customised further to a visually different representation.

### 2.5 Greek Letters

\( \TeX \) defines Greek letters in math mode somewhat differently from Latin letters. The following two features redefine to the standard \( \TeX \) Greek letters.

**Feature greekcaps.** Capital Greek letters are declared as operators instead of plain letters, and therefore they are typeset in an upright shape. To typeset them in italic shape (as all the other letters representing variables) one can use `\mathnormal`, but this may be tedious if most capital Greek letters in a document actually represent variables.

The feature `greekcaps` redefines the 11 capital Greek letters `\Gamma`, `\Delta`, `\Theta`, `\Lambda`, `\Xi`, `\Pi`, `\Sigma`, `\Upsilon`, `\Phi`, `\Psi` and `\Omega` provided by \( \TeX \) to have a default italic shape. Upright capital Greek letters remain accessible by switching to the upright shape using `\mathrm` or by declaring them as part of an operator, e.g. `\\operatorname` or `\DeclareMathOperator` (package `amsmath`).

The optional argument `greekcaps=pre` will instead define the macros `\preGamma`, etc., and keep the original definitions.

**Feature greeklower.** Lowercase Greek letters are fixed to the default math italic font because (unfortunately) no upright counterparts exist in the Compute Modern family of fonts.

The feature `greeklower` redefines the 23 lowercase Greek letters `\alpha`, ..., `\omega` as well as their 6 variants `\varepsilon`, `\vartheta`, `\varpi`, `\varphi`, and `\varsigma` defined by \( \TeX \) to be elements of the regular math alphabet. This allows them to be typeset in different font series such as `\mathbfit` described below. However, when trying to cast them in upright shape they will be typeset as altogether different symbols, e.g. `\textit{\alpha}` becomes the ligature ‘ff’ which occupies the same slot in the \( \TeX \) font encodings OML vs. OT1. Hence, some caution is needed when this feature is used.

The optional argument `greeklower=pre` will instead define the macros `\preAlpha`, etc., and keep the original definitions.
2.6 Bold Fonts

**autobold** Feature autobold. Sectioning commands such as \chapter, \section, \paragraph, etc., but also \maketitle often change the font series to bold. However, any math symbols contained in the titles are typeset in the regular, non-bold series by default leading to a non-uniform appearance or calling for further manual adjustments using \boldmath. One might argue that it is bad practice to have math symbols in titles in the first place, but this point of view perhaps does not apply universally.

\bfseries \mdseries The feature autobold overwrites the \LaTeX font commands \bfseries, \mdseries as well as \normalfont to automatically switch the math fonts to their bold version. Derived commands such as \section, etc., will also switch the math fonts to the bold series.

**mathbold** Feature mathbold. The feature mathbold defines a bold italic math font \mathbold. To typeset bold italic letters simply use \mathbold{abc}. To make this work for lowercase Greek letters as well, the feature greeklower must be activated. The optional argument mathbold={\cmd} specifies an alternative command name \cmd for \mathbold, e.g. mathbold={\mathbit}.

3 Information

3.1 Copyright

Copyright © 2018 Niklas Beisert

This work may be distributed and/or modified under the conditions of the \LaTeX Project Public License, either version 1.3 of this license or (at your option) any later version. The latest version of this license is in http://www.latex-project.org/lppl.txt and version 1.3 or later is part of all distributions of \LaTeX version 2005/12/01 or later.

This work has the LPPL maintenance status ‘maintained’.

The Current Maintainer of this work is Niklas Beisert.

This work consists of the files README.txt, mathfixs.ins and mathfixs.dtx as well as the derived files mathfixs.sty, mafxsamp.tex and mathfixs.pdf.

3.2 Files and Installation

The package consists of the files:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>README.txt</td>
<td>readme file</td>
</tr>
<tr>
<td>mathfixs.ins</td>
<td>installation file</td>
</tr>
<tr>
<td>mathfixs.dtx</td>
<td>source file</td>
</tr>
<tr>
<td>mathfixs.sty</td>
<td>package file</td>
</tr>
<tr>
<td>mafxsamp.tex</td>
<td>sample file</td>
</tr>
<tr>
<td>mathfixs.pdf</td>
<td>manual</td>
</tr>
</tbody>
</table>

The distribution consists of the files README.txt, mathfixs.ins and mathfixs.dtx.

- Run (pdf)\LaTeX on mathfixs.dtx to compile the manual mathfixs.pdf (this file).
- Run \LaTeX on mathfixs.ins to create the package mathfixs.sty and the sample mafxsamp.tex. Copy the file mathfixs.sty to an appropriate directory of your \LaTeX distribution, e.g. texmf-root/tex/latex/mathfixs.
3.3 Related CTAN Packages

The package is related to other packages available at CTAN:

- This package uses the package `keyval` from the `graphics` bundle to process the options for the package, environments and macros. Compatibility with the `keyval` package has been tested with v1.15 (2014/10/28).
- This package was designed to be compatible with the package `amsmath`. To prevent `amsmath` from overwriting some features, it should be loaded before the present package. Compatibility with the `amsmath` package has been tested with v2.17a (2017/09/02).
- This package reproduces the functionality of the package `fixmath` v0.9 (2000/04/11) from the bundle `was`.
- Functionality to typeset common fractions is also provided by the packages `nicefrac` from the bundle `units` and `xfrac` offering a more advanced implementation.

3.4 Revision History

v1.01: 2018/12/30

- fix for \vfrac in aligned math

v1.0: 2018/01/17

- first version published on CTAN

A Sample File

In this section we provide an example of how to use some of the `mathfixs` features. We also test the behaviour in some special cases.

Preamble. Standard document class:

1 \documentclass[12pt]{article}

Use package `geometry` to adjust the page layout, adjust the paragraph shape:

2 \usepackage{geometry}
3 \geometry{layout=a4paper}
4 \geometry{paper=a4paper}
5 \geometry{margin=3cm}
6 \parindent0pt

Include `amsmath` and the `mathfixs` package:

7 \RequirePackage{amsmath}
8 \RequirePackage[autobold]{mathfixs}

Declare features to be implemented globally:

9 \ProvideMathFix{greekcaps,mathbold}
10 \ProvideMathFix{frac,rfrac,vfrac}
11 \ProvideMathFix{multskip}
Fractions.

\paragraph{Fractions.}

Fraction spacing:
\[
x\frac{a+b}{c+d}\frac{e}{f}.
\]

Vulgar fractions:

Recipe for \(\approx 3\) pancakes (scale accordingly):

Whisk together one large egg, \(\frac{1}{8}\) \(\ell\) milk, \(50\mathinner{\mathrm{g}}\) flour (mix \(\frac{2}{3}\) wholemeal flour and \(\frac{1}{3}\) white flour); fry in pan. Feel free to use more flour than indicated.

Rational numbers:
\[
\rfract{1}{2}x^2 + \rfract{1}{6} y^3 + \rfract{1}{4} x^2 y^2
\]

Radicals.

\paragraph{Radicals.}

Original radicals spacing:
\[
y\sqrt{x}z, \quad y\sqrt[\{\}]{x}z, \quad y\sqrt[i]{x}z, \quad y\sqrt[n]{x}z, \quad y\sqrt[3]{x}z, \quad y\sqrt[123]{x}z
\]

Radicals spacing (feature introduced in document body):
\[
\ProvideMathFix{root}
y\sqrt{x}z, \quad y\sqrt[\{\}]{x}z, \quad y\sqrt[i]{x}z, \quad y\sqrt[n]{x}z, \quad y\sqrt[3]{x}z, \quad y\sqrt[123]{x}z
\]

Radicals with closing mark (using a locally defined option):
\[
\ProvideMathFix{rootclose}
y\sqrt{x}z, \quad y\sqrt[\{\}]{x}z, \quad y\sqrt[i]{x}z, \quad y\sqrt[n]{x}z, \quad y\sqrt[3]{x}z, \quad y\sqrt[123]{x}z
\]
Radicals with class \texttt{mathinner}:

\[
\provideMathFix{rootclass=\texttt{mathinner}}
\]

\[
\sqrt[n]{x}z, \quad \sqrt[3]{x}z, \quad \sqrt[123]{x}z
\]

Spaces Representing Multiplication.

Explicit spacing:

\[
\newcommand{\der}{\mathrm{d}}
\]

\[
\int x \, \der x
\]

Implicit spacing:

\[
\newcommand{\diff}[1]{\texttt{\mathinner{\der#1}}}
\]

\[
\int x \diff{x}
\]

Greek Letters.

Capital letters:

\[
\Gamma \quad \mathrm{\Gamma} \quad c\operatorname{\Gamma}(x)
\]

Bold Text with Math Symbols.

\[
\text{Bold Text with Math Symbols: } a\mathrm{\alpha}\Gamma$
\]

End of document body:
B Implementation

In this section we describe the package \texttt{mathfixs.sty}.

\textbf{Required Packages.} The package loads the package \texttt{keyval} if not yet present. \texttt{keyval} is used for extended options processing:

\begin{verbatim}
\RequirePackage{keyval}
\end{verbatim}

\textbf{Automatically Bold Maths.}

\begin{verbatim}
\bfseries \mdseries \normalfont
\end{verbatim}

Define replacements for \texttt{\bfseries}, \texttt{\mdseries} and \texttt{\normalfont} by appending \texttt{\boldmath} or \texttt{\unboldmath} (if not already in math mode where font selection works differently). The chain of \texttt{\expandafter} directives fills in the original definition:

\begin{verbatim}
\expandafter\def\expandafter\mafx@bfseries\expandafter
{\bfseries\ifmmode\else\boldmath\fi}
\expandafter\def\expandafter\mafx@mdseries\expandafter
{\mdseries\ifmmode\else\unboldmath\fi}
\expandafter\def\expandafter\mafx@normalfont\expandafter
{\normalfont\ifmmode\else\unboldmath\fi}
\end{verbatim}

\textbf{autobold} Implement the \texttt{autobold} fix:

\begin{verbatim}
\define@key{mafx@}{autobold}{[]}{%}
\let\bfseries=\mafx@bfseries
\let\mdseries=\mafx@mdseries
\let\normalfont=\mafx@normalfont
\end{verbatim}

\textbf{Bold Italic Math.}

\begin{verbatim}
\mathbold \mathbold
\end{verbatim}

Define a new math alphabet \texttt{\mathbold} as the bold series and italic shape of the standard computer modern math font (see package \texttt{fixmath}):

\begin{verbatim}
\DeclareMathAlphabet{\mafx@mathbold}{OML}{cmm}{b}{it}
\end{verbatim}

\textbf{autobold} Implement \texttt{\mathbold} (or alternative macro name):

\begin{verbatim}
\define@key{mafx@}{mathbold}{\mathbold}{\let#1=\mafx@mathbold}
\end{verbatim}

\textbf{Spacing Adjustment for Fractions.} Save primitive definition of \texttt{\over} into \texttt{\@@over} (compatible with \texttt{amsmath}):

\begin{verbatim}
\ifdefined\@@over\else\let\@@over=\over\fi
\end{verbatim}

Define math class selectors for fractions (without/with delimiters):

\begin{verbatim}
\def\mafx@frac@class{\mathinner}
\def\mafx@frac@delimclass{\mathopen{}\mathclose}
\end{verbatim}

\textbf{\frac} Define replacement for \texttt{\frac} which uses a configurable math class selector:

\begin{verbatim}
\DeclareRobustCommand{\mafx@frac}[2]{%\begingroup#1\endgroup\@@over#2}}
\end{verbatim}
\texttt{\textbackslash genfrac} Define replacement for \texttt{\textbackslash genfrac} (called by \texttt{\textbackslash genfrac}) which uses the appropriate math class selector. If the package amsmath is not loaded, this definition will have no impact:

\begin{verbatim}
def\mafx@@genfrac#1#2#3#4#5{\begingroup%
    \ifx#2\@@overwithdelims\let\mafx@frac@class\mafx@frac@delimclass\fi%
    \ifx#2\@@abovewithdelims\let\mafx@frac@class\mafx@frac@delimclass\fi%
    \ifx#2\@@atopwithdelims\let\mafx@frac@class\mafx@frac@delimclass\fi%
    \mafx@frac@class{#1{\begingroup#4\endgroup#2#3\relax#5}}%
\endgroup}
\end{verbatim}

\texttt{\textbackslash frac} Implement the replacement for \texttt{\textbackslash frac} and \texttt{\textbackslash genfrac}:

\begin{verbatim}
def\mafx@frac{}{}
let\frac=\mafx@frac
let\genfrac=\mafx@@genfrac
\end{verbatim}

\texttt{\textbackslash fracclass} Configure the math classes for fractions (without/with delimiters):

\begin{verbatim}
def\mafx@fracclass{\def\mafx@frac@class{#1}}
def\mafx@fracdelimclass{\def\mafx@frac@delimclass{#1}}
\end{verbatim}

\textbf{Small Fractions.}

\texttt{\textbackslash rfrac} Define a fraction in text style or smaller using the ordinary math class (no surrounding space), e.g. $\frac{1}{2}$:

\begin{verbatim}
\DeclareRobustCommand{\mafx@rfrac}[2]{%\textstyle{\begingroup#1\endgroup\@@over{#2}}%}
\end{verbatim}

\texttt{\textbackslash rfrac} Implement \texttt{\textbackslash rfrac} (or alternative macro name):

\begin{verbatim}
def\mafx@rfrac{}[\rfrac]{%let#1=\mafx@rfrac
\end{verbatim}

\textbf{Vulgar Fractions.} Define the math class and spacing parameters as (negative) spaces around the dividing slash:

\begin{verbatim}
def\mafx@vfrac@class{\mathinner}
def\mafx@vfrac@preskip{\thinmuskip}
def\mafx@vfrac@postskip{0.6667\thinmuskip}
\end{verbatim}

\texttt{\textbackslash vfrac} Define a vulgar representation of a rational number, e.g. $\frac{1}{2}$. Automatically switch to math mode if in text mode:

\begin{verbatim}
\DeclareRobustCommand{\mafx@vfrac}[2]{%\textstyle%\begin{array}{c}
    ^{-}\{#1\}^{-}\mkern-\mafx@vfrac@preskip/\mkern-\mafx@vfrac@postskip_{#2}\end{array}}%}
\end{verbatim}

\texttt{\textbackslash vfrac} Implement \texttt{\textbackslash vfrac} (or alternative macro name):

\begin{verbatim}
def\mafx@vfrac{}[\vfrac]{%let#1=\mafx@vfrac
\end{verbatim}

\texttt{\textbackslash vfracclass} Define configurable skip parameters for \texttt{\textbackslash vfrac}:

\begin{verbatim}
def\mafx@vfrackey{\texttt{\textbackslash vfrac}}{\texttt{\textbackslash vfracclass}}{\texttt{\textbackslash vfracskippre}}{\texttt{\textbackslash vfracskippost}}
\end{verbatim}
Spacing Adjustment for Roots. Define some parameters for the improved root macros. \mafx@root@close stores the relative height where the closing bar for the radical starts; empty disables the closing bar. \mafx@root@class stores the math class for a root. \mafx@root@endskip stores space to be added after the radicand but within the radical in math units. \mafx@root@preskip and \mafx@root@postskip store space to be added before or after the radical sign:

\begin{verbatim}
\let\mafx@root@close=\@empty
\def\mafx@root@class{}
\def\mafx@root@endskip{0.6667\thinmuskip}
\def\mafx@root@preskip{0mu}
\def\mafx@root@postskip{0.3333\thinmuskip}
\end{verbatim}

\sqrt Replacement for \sqrt which passes an empty first argument instead of calling \sqrtsign:

\begin{verbatim}
\DeclareRobustCommand\mafx@sqrt{\@ifnextchar[\@sqrt{\@sqrt[]}}
\def\mafx@@sqrt[#1]{\root#1\of}
\end{verbatim}

\root Replacement for \root \ldots \of which stores the \leftroot and \uproot parameters specified in the exponent (see package amsmath). It does so by first storing them in global parameters and then converting them to local ones to avoid interference with nested radicals. As usual, the macro then passes on to \r@@t with \mathpalette:

\begin{verbatim}
\def\mafx@root#1\of{
\setbox\rootbox\hbox{$\m@th\scriptscriptstyle{\gdef\gleftroot{0}\gdef\guproot{0}\def\leftroot##1{\gdef\gleftroot{##1}}\def\uproot##1{\gdef\guproot{##1}}#1}$}
\let\mafx@leftroot=\gleftroot\let\mafx@uproot=\guproot
\mathpalette\r@@t}
\end{verbatim}

The replacement for \r@@t typesets the radical by placing the exponent in an elevated box. First, select desired math class:

\begin{verbatim}
\def\mafx@root@class{}\def\mafx@root@class{\#1}\of
\end{verbatim}

Determine the font selector for the current style:

\begin{verbatim}
\ifx\scriptstyle\let\mafx@tmp@fontsel=\scriptfont\else\fi
\ifx\scriptstyle\let\mafx@tmp@fontsel=\scriptscriptfont\else\fi
\let\mafx@tmp@fontsel=\textfont1
\let\mafx@tmp@fontsel=\textfont1
\end{verbatim}

Generate a radical with empty radicand in cramped style (see package mathtools) at the desired height and depth and store in a box for subsequent measurements:

\begin{verbatim}
\sbox\radicalbox{$\m@th\scriptscriptstyle{\fontdimen8\textfont3=\fontdimen5\textfont2\addtolength{\ht\z@}{-0.25\fontdimen8\textfont3}\addtolength{\ht\z@}{-0.25\fontdimen8\textfont3}}$
\end{verbatim}
\setbox\z@=\hbox{\m@th#1\sqrtsign{16}}\setlength\dimen@{-\wd\rootbox}\addtolength\dimen@{0.6\wd\z@}\ifdim\dimen@>0pt\else\setlength\dimen@{0pt}\fi\kern\dimen@\setlength\dimen@{0.6\ht\z@}\addtolength\dimen@{-0.6\dp\z@}\setbox\@ne\hbox{\m@th#1\mskip\mafx@uproot mu}\addtolength\dimen@{\wd\@ne}\mkern-\mafx@leftroot mu\raise\dimen@\copy\rootbox\mkern\mafx@leftroot mu\kern-0.6\wd\z@\setlength\dimen@{0.6\ht\z@}\addtolength\dimen@{-0.6\dp\z@}\ifx\mafx@root@close\@empty\else\setlength\dimen@{\fontdimen8\mafx@tmp@fontsel3}\lower\dimen@\hbox{\vrule width\dimen@ height\ht\z@ depth -\mafx@root@close\ht\z@}\fi\mkern\mafx@root@postskip\let\sqrt=\mafx@sqrt\let\@sqrt=\mafx@@sqrt\let\root=\mafx@root\let\r@@t=\mafx@r@@t

\newcommand{\space}{\makebox[0pt][c]{\hspace{0pt}}}
\. Define \. to represent a thin math skip when in math mode. Retain original definition as an accent in text mode. Switch is performed by temporarily storing the appropriate macro which is subsequently issued so that the correct number of arguments are fetched:
\let\mafx@old@dot=\.
\def\mafx@dot@skip{\thinmuskip}
\def\mafx@dot{\mskip\mafx@dot@skip}
\def\mafx@per@dot{\begingroup\ifmmode\def\mafx@tmp{\mafx@dot}\else%\def\mafx@tmp{\mafx@old@dot}\fi\expandafter\endgroup\mafx@tmp}

\multskip Implement definition of \.:
\define@key{mafx@}{multskip}{\thinmuskip}{%\let\=.\mafx@per@dot\def\mafx@dot@skip{#1}%}

Italic Capital Greek Letters.
\Gamma Define capital Greek letters as letters (instead of the default assignment as operators). This implementation follows the package fixmath:
\DeclareMathSymbol{\mafx@Gamma}{\mathalpha}{letters}{0}
\DeclareMathSymbol{\mafx@Delta}{\mathalpha}{letters}{1}
\DeclareMathSymbol{\mafx@Theta}{\mathalpha}{letters}{2}
\DeclareMathSymbol{\mafx@Lambda}{\mathalpha}{letters}{3}
\DeclareMathSymbol{\mafx@Xi}{\mathalpha}{letters}{4}
\DeclareMathSymbol{\mafx@Pi}{\mathalpha}{letters}{5}
\DeclareMathSymbol{\mafx@Sigma}{\mathalpha}{letters}{6}
\DeclareMathSymbol{\mafx@Upsilon}{\mathalpha}{letters}{7}
\DeclareMathSymbol{\mafx@Phi}{\mathalpha}{letters}{8}
\DeclareMathSymbol{\mafx@Psi}{\mathalpha}{letters}{9}
\DeclareMathSymbol{\mafx@Omega}{\mathalpha}{letters}{10}

\greekcaps Implement italic capital Greek letters. The optional argument is used as a prefix for the definitions:
\define@key{mafx@}{greekcaps}{%\expandafter\let\csname #1Gamma\endcsname=\mafx@Gamma\expandafter\let\csname #1Delta\endcsname=\mafx@Delta\expandafter\let\csname #1Theta\endcsname=\mafx@Theta\expandafter\let\csname #1Lambda\endcsname=\mafx@Lambda\expandafter\let\csname #1Xi\endcsname=\mafx@Xi\expandafter\let\csname #1Pi\endcsname=\mafx@Pi\expandafter\let\csname #1Sigma\endcsname=\mafx@Sigma\expandafter\let\csname #1Upsilon\endcsname=\mafx@Upsilon\expandafter\let\csname #1Phi\endcsname=\mafx@Phi\expandafter\let\csname #1Psi\endcsname=\mafx@Psi\expandafter\let\csname #1Omega\endcsname=\mafx@Omega%}

Lowercase Greek Letters in Standard Math Type.
\alpha Define lowercase Greek letters in standard type \mathalpha (instead of the default assiment \mathord). This implementation follows the package fixmath:
\DeclareMathSymbol{\mafx@alpha}{\mathalpha}{letters}{11}
\DeclareMathSymbol{\mafx@beta}{\mathalpha}{letters}{12}
\DeclareMathSymbol{\mafx@gamma}{\mathalpha}{letters}{13}
\DeclareMathSymbol{\mafx@delta}{\mathalpha}{letters}{14}
\DeclareMathSymbol{\mafx@epsilon}{\mathalpha}{letters}{15}
\DeclareMathSymbol{\mafx@zeta}{\mathalpha}{letters}{16}
\DeclareMathSymbol{\mafx@eta}{\mathalpha}{letters}{17}
\DeclareMathSymbol{\mafx@theta}{\mathalpha}{letters}{18}
\DeclareMathSymbol{\mafx@iota}{\mathalpha}{letters}{19}
\DeclareMathSymbol{\mafx@kappa}{\mathalpha}{letters}{20}
\DeclareMathSymbol{\mafx@lambda}{\mathalpha}{letters}{21}
\DeclareMathSymbol{\mafx@mu}{\mathalpha}{letters}{22}
\DeclareMathSymbol{\mafx@nu}{\mathalpha}{letters}{23}
\DeclareMathSymbol{\mafx@xi}{\mathalpha}{letters}{24}
\DeclareMathSymbol{\mafx@pi}{\mathalpha}{letters}{25}
\DeclareMathSymbol{\mafx@rho}{\mathalpha}{letters}{26}
\DeclareMathSymbol{\mafx@sigma}{\mathalpha}{letters}{27}
\DeclareMathSymbol{\mafx@tau}{\mathalpha}{letters}{28}
\DeclareMathSymbol{\mafx@upsilon}{\mathalpha}{letters}{29}
\DeclareMathSymbol{\mafx@phi}{\mathalpha}{letters}{30}
\DeclareMathSymbol{\mafx@chi}{\mathalpha}{letters}{31}
\DeclareMathSymbol{\mafx@psi}{\mathalpha}{letters}{32}
\DeclareMathSymbol{\mafx@omega}{\mathalpha}{letters}{33}
\DeclareMathSymbol{\mafx@varepsilon}{\mathalpha}{letters}{34}
\DeclareMathSymbol{\mafx@vartheta}{\mathalpha}{letters}{35}
\DeclareMathSymbol{\mafx@varpi}{\mathalpha}{letters}{36}
\DeclareMathSymbol{\mafx@varphi}{\mathalpha}{letters}{37}

\greeklower
Implement standard type lowercase Greek letters. The optional argument is used as a prefix for the definitions:
Package Options.

\ProvideMathFix 

Implement a particular fix or option:

\newcommand{\ProvideMathFix}[1]{\setkeys{mafx@}{#1}}

Pass undeclared options on to keyval processing:

\DeclareOption*{\expandafter{\ProvideMathFix}\expandafter{\CurrentOption}}

Process package options:

\ProcessOptions
