1 Introduction

Welcome to \LaTeX{} 2\epsilon, the new standard version of the \LaTeX{} Document Preparation System.

This document describes how to take advantage of the new features of \LaTeX{}, and how to process your old \LaTeX{} documents with \LaTeX{} 2\epsilon. However, this document is only a brief introduction to the new facilities and is intended for authors who are already familiar with the old version of \LaTeX{}. It is not a reference manual for \LaTeX{} 2\epsilon nor is it a complete introduction to \LaTeX{}.

It is somewhat of an historical document now, since \LaTeX{} 2\epsilon came into existence in 1994.

1.1 \LaTeX{} 2\epsilon—The new \LaTeX{} release

(well, for more than 10 years now)

The previous version of \LaTeX{} was known as \LaTeX{} 2.09. Over the years many extensions have been developed for \LaTeX{}. This is, of course, a sure sign of its continuing popularity but it has had one unfortunate result: incompatible \LaTeX{} formats came into use at different sites. This included ‘standard \LaTeX{} 2.09’, \LaTeX{} built with the New Font Selection Scheme (NFSS), Slides, AMS-\LaTeX{}, and so on. Thus, to process documents from various places, a site maintainer was forced to keep multiple versions of the \LaTeX{} program. In addition, when looking at a source file it was not always clear for which format the document was written.

To put an end to this unsatisfactory situation, \LaTeX{} 2\epsilon has been produced; it brings all such extensions back under a single format and thus prevents the proliferation of mutually incompatible dialects of \LaTeX{} 2.09. With \LaTeX{} 2\epsilon the ‘new font selection scheme’ is standard and, for example, amsmath (formerly the AMS-\LaTeX{} format) or slides (formerly the Slides format) are simply extensions, which may be loaded by documents using the same base format.
The introduction of a new release also made it possible to add a small number of often-requested features and to make the task of writing packages and classes simpler.

1.2 \LaTeX{}3—The long-term future of \LaTeX{}

\LaTeX{}2e is the consolidation step in a comprehensive reimplementation of the \LaTeX{} system. The next major release of \LaTeX{} will be \LaTeX{}3, which will include a radical overhaul of the document designers’ and package writers’ interface to \LaTeX{}.

\LaTeX{}3 is a long-term research project but, until it is completed, the project team are committed to the active maintenance of \LaTeX{}2e. Thus the experience gained from the production and maintenance of \LaTeX{}2e will be a major influence on the design of \LaTeX{}3. A brief description of the project can be found in the document \texttt{ltx3info.tex}.

If you would like to support the project then you are welcome to send donations to the \LaTeX{}3 Project Fund; this has been set up to help the research team by financing various expenses associated with this voluntary work of maintaining the current \LaTeX{} and developing \LaTeX{}3.

The fund is administered by The \TeX{} Users Group and by various local user groups. Information about making donations and joining these groups is available from:

\begin{center}
\url{http://www.tug.org/lugs.html}
\end{center}

The \LaTeX{}3 project has its home page on the World Wide Web at:

\begin{center}
\url{http://www.latex-project.org/}
\end{center}

This page describes \LaTeX{} and the \LaTeX{}3 project, and contains pointers to other \LaTeX{} resources, such as the user guides, the \TeX{} Frequently Asked Questions, and the \LaTeX{} bugs database.

Older articles covering aspects of the \LaTeX{}3 project are also available for anonymous ftp from the Comprehensive \TeX{} Archive, in the directory:

\begin{center}
\texttt{ctan:info/ltx3pub}
\end{center}

The file \texttt{ltx3pub.bib} in that directory contains an abstract of each of the files.

1.3 Overview

This document contains an overview of the new structure and features of \LaTeX{}. It is not a self-contained document, as it contains only the features of \LaTeX{} which have changed since version 2.09. You should read this document in conjunction with an introduction to \LaTeX{}. 

3
Section 2 contains an overview of the new structure of \LaTeX{} documents. It describes how classes and packages work and how class and package options can be used. It lists the standard packages and classes which come with \LaTeX{}.

Section 3 describes the new commands available to authors in \LaTeX{} 2ε.

Section 4 shows how to process old \LaTeX{} documents with \LaTeX{} 2ε.

Section 6 contains advice on dealing with problems you may encounter in running \LaTeX{} 2ε. It lists some error messages which are new in \LaTeX{} 2ε and it describes some of the more common problems and how to cure them, or where to find further information.

1.4 Further information

For a general introduction to \LaTeX{}, including the new features of \LaTeX{} 2ε, you should read \textit{\LaTeX{}: A Document Preparation System} by Leslie Lamport [4].

A more detailed description of the new features of \LaTeX{}, including an overview of more than 200 packages and nearly 1000 ready to run examples, is to be found in \textit{The \LaTeX{} Companion second edition} by Frank Mittelbach and Michel Goossens [5].

Packages and programs for producing and manipulating graphics are discussed at length in \textit{The \LaTeX{} Graphics Companion} by Michel Goossens, Sebastian Rahtz and Frank Mittelbach [1].

Solutions for publishing with \LaTeX{} on the World Wide Web are given in \textit{The \LaTeX{} Web Companion} by Michel Goossens and Sebastian Rahtz [2].

For more information about the many new \LaTeX{} packages you should read the package documentation, which should be available from the same source as your copy of \LaTeX{}.

There are a number of documentation files which accompany every copy of \LaTeX{}. A copy of \LaTeX{} News will come out with each six-monthly release of \LaTeX{}; it will be found in the files \texttt{ltnews*.tex}. The class- and package-writer’s guide \textit{\LaTeX{} 2ε for Class and Package Writers} describes the new \LaTeX{} features for writers of document classes and packages; it is in \texttt{clsguide.tex}. The guide \textit{\LaTeX{} 2ε Font Selection} describes the \LaTeX{} font selection scheme for class- and package-writers; it is in \texttt{fntguide.tex}. Support for Cyrillic languages in \LaTeX{} is described in \textit{Cyrillic languages support in \LaTeX{}}.

The documented source code (from the files used to produce the kernel format via \texttt{latex.ltx}) is now available as \textit{The \LaTeX{} 2ε Sources}. This very large document also includes an index of \LaTeX{} commands. It can be typeset from the \LaTeX{} file \texttt{source2e.tex} in the \texttt{base} directory, using the source files and the class file \texttt{ltxdoc.cls} from this directory.

For more information about \TeX{} and \LaTeX{}, please contact your local \TeX{} Users Group, or the international \TeX{} Users Group (see page 3).
2 Classes and packages

This section describes the new structure of \LaTeX documents and the new types of file: classes and packages.

2.1 What are classes and packages?

The main difference between \LaTeX 2.09 and \LaTeX 2ε is in the commands before \begin{document}.

In \LaTeX 2.09, documents had styles, such as article or book, and options, such as twoside or epsfig. These were indicated by the \documentstyle command:

\documentstyle[(options)]{(style)}

For example, to specify a two-sided article with encapsulated PostScript figures, you said:

\documentstyle[twoside,epsfig]{article}

However, there were two different types of document style option: built-in options such as twoside; and packages such as epsfig.sty. These were very different, since any \LaTeX document style could use the epsfig package but only document styles which declared the twoside option could use that option.

To avoid this confusion, \LaTeX 2ε differentiates between built-in options and packages. These are given by the new \documentclass and \usepackage commands:

\documentclass[(options)]{(class)}
\usepackage[(options)]{(packages)}

For example, to specify a two-sided article with encapsulated PostScript figures, you now write:

\documentclass[twoside]{article}
\usepackage{epsfig}

You can load more than one package with a single \usepackage command; for example, rather than writing:

\usepackage{epsfig}
\usepackage{multicol}

you can specify:

\usepackage{epsfig,multicol}
Note that \LaTeX 2ε still understands the \LaTeX 2.09 \texttt{\textbackslash documentstyle} command. This command causes \LaTeX 2ε to enter \LaTeX 2.09 compatibility mode, which is described in Section 4.

You should not, however, use the \texttt{\textbackslash documentstyle} command for new documents because this compatibility mode is very slow and the new features of \LaTeX 2ε are not available in this mode.

To help differentiate between classes and packages, document classes now end with \texttt{.cls} rather than \texttt{.sty}. Packages still end with \texttt{.sty}, since most \LaTeX 2.09 packages work well with \LaTeX 2ε.

### 2.2 Class and package options

In \LaTeX 2.09, only document styles could have options such as \texttt{twoside} or \texttt{draft}. In \LaTeX 2ε, both classes and packages are allowed to have options. For example, to specify a two-sided article with graphics using the \texttt{dvips} driver, you write:

\begin{verbatim}
\documentclass[twoside]{article}
\usepackage[dvips]{graphics}
\end{verbatim}

It is possible for packages to share common options. For example, you could, in addition, load the \texttt{color} package by specifying:

\begin{verbatim}
\documentclass[twoside]{article}
\usepackage[dvips]{graphics}
\usepackage[dvips]{color}
\end{verbatim}

But because \texttt{\usepackage} allows more than one package to be listed, this can be shortened to:

\begin{verbatim}
\documentclass[twoside]{article}
\usepackage[dvips]{graphics,color}
\end{verbatim}

In addition, packages will also use each option given to the \texttt{\documentclass} command (if they know what to do with it), so you could also write:

\begin{verbatim}
\documentclass[twoside,dvips]{article}
\usepackage[graphics,color]{dvips}
\end{verbatim}

Class and package options are covered in more detail in \textit{The \LaTeX Companion} and in \textit{\LaTeX 2ε for Class and Package Writers}.
2.3 Standard classes

The following classes are distributed with LATEX:

article The article class described in \textit{LATEX: A Document Preparation System}.

book The book class described in \textit{LATEX: A Document Preparation System}.

report The report class described in \textit{LATEX: A Document Preparation System}.

letter The letter class described in \textit{LATEX: A Document Preparation System}.

slides The slides class described in \textit{LATEX: A Document Preparation System}, formerly STEX.

proc A document class for proceedings, based on article. Formerly the proc package.

ltxdoc The document class for documenting the LATEX program, based on article.

ltxguide The document class for \textit{LATEX 2\epsilon} for Authors and \textit{LATEX 2\epsilon} for Class and Package Writers, based on article. The document you are reading now uses the ltxguide class. The layout for this class is likely to change in future releases of LATEX.

ltnews The document class for the \textit{LATEX News} information sheet, based on article. The layout for this class is likely to change in future releases of LATEX.

minimal This class is the bare minimum (3 lines) that is needed in a LATEX class file. It just sets the text width and height, and defines \texttt{\normalsize}. It is principally intended for debugging and testing LATEX code in situations where you do not need to load a ‘full’ class such as article. If, however, you are designing a completely new class that is aimed for documents with structure radically different from the structure supplied by the article class, then it may make sense to use this as a base and add to it code implementing the required structure, rather than starting from article and modifying the code there.

2.4 Standard packages

The following packages are distributed with LATEX:

alltt This package provides the alltt environment, which is like the verbatim environment except that \{, \}, and \} have their usual meanings. It is described in alltt.dtx and \textit{LATEX: A Document Preparation System}.

doc This is the basic package for typesetting the documentation of LATEX programs. It is described in doc.dtx and in \textit{The LATEX Companion}. 

\textit{New feature 1995/12/01}

\textit{New feature 1994/12/01}
**exscale**  This provides scaled versions of the math extension font. It is described in `exscale.dtx` and *The \LaTeX\ Companion*.

**fontenc**  This is used to specify which font encoding \LaTeX\ should use. It is described in `loutenc.dtx`.

**graphpap**  This package defines the \texttt{\graphpaper} command; this can be used in a \texttt{picture} environment.

**ifthen**  Provides commands of the form ‘if… then do… otherwise do…’. It is described in `ifthen.dtx` and *The \LaTeX\ Companion*.

**inputenc**  This is used to specify which input encoding \LaTeX\ should use. It is described in `inputenc.dtx`.

**latexsym**  \LaTeX\ 2ε no longer loads the \LaTeX\ symbol font by default. To access it, you should use the `latexsym` package. It is described in `latexsym.dtx` and in *The \LaTeX\ Companion*; see also Section 6.

**makeidx**  This provides commands for producing indexes. It is described in \LaTeX: A Document Preparation System and in *The \LaTeX\ Companion*.

**newlfont**  This is used to emulate the font commands of \LaTeX\ 2.09 with the New Font Selection Scheme. It is described in *The \LaTeX\ Companion*.

**oldlfont**  This is used to emulate the font commands of \LaTeX\ 2.09. It is described in *The \LaTeX\ Companion*.

**showidx**  This causes the argument of each `\index` command to be printed on the page where it occurs. It is described in \LaTeX: A Document Preparation System.

**syntonly**  This is used to process a document without typesetting it. It is described in `syntonly.dtx` and in *The \LaTeX\ Companion*.

**tracefnt**  This allows you to control how much information about \LaTeX\’s font loading is displayed. It is described in *The \LaTeX\ Companion*.

### 2.5 Related software

The following software should be available from the same distributor as your copy of \LaTeX\ 2ε. You should obtain at least the `graphics` and `tools` collections in order to have all the files described in \LaTeX: A Document Preparation System.

The `amsmath` package (part of `amslatex` and formerly known as `amstex`) and `babel` are also mentioned in the list of ‘standard packages’ in section C.5.2 of that book.

**amslatex**  Advanced mathematical typesetting from the American Mathematical Society. This includes the `amsmath` package; it provides many commands for typesetting mathematical formulas of higher complexity. It is produced and supported by the American Mathematical Society and it is described in *The \LaTeX\ Companion*. 

New feature 1994/12/01

2.5 Related software

The following software should be available from the same distributor as your copy of \LaTeX\ 2ε. You should obtain at least the `graphics` and `tools` collections in order to have all the files described in \LaTeX: A Document Preparation System. The `amsmath` package (part of `amslatex` and formerly known as `amstex`) and `babel` are also mentioned in the list of ‘standard packages’ in section C.5.2 of that book.

**amslatex**  Advanced mathematical typesetting from the American Mathematical Society. This includes the `amsmath` package; it provides many commands for typesetting mathematical formulas of higher complexity. It is produced and supported by the American Mathematical Society and it is described in *The \LaTeX\ Companion*.

New feature 1994/12/01

8
babel This package and related files support typesetting in many languages. It is described in *The \LaTeX Companion*.

cyrillic Everything you need (except the fonts themselves) for typesetting with Cyrillic fonts.

graphics This includes the \texttt{graphics} package which provides support for the inclusion and transformation of graphics, including files produced by other software. Also included, is the \texttt{color} package which provides support for typesetting in colour. Both these packages are described in *\LaTeX: A Document Preparation System*.

psnfss Everything you need (except the fonts themselves) for typesetting with a large range of Type 1 (PostScript) fonts.

tools Miscellaneous packages written by the \LaTeX3 project team.

These packages come with documentation and each of them is also described in at least one of the books *The \LaTeX Companion* and *\LaTeX: A Document Preparation System*.

2.5.1 Tools

This collection of packages includes, at least, the following (some files may have slightly different names on certain systems):

array Extended versions of the environments \texttt{array}, \texttt{tabular} and \texttt{tabular*}, with many extra features.

calc Enables the use of certain algebraic notation when specifying values for lengths and counters.

dcolumn Alignment on ‘decimal points’ in tabular entries. Requires the \texttt{array} package.

delarray Adds ‘large delimiters’ around arrays. Requires \texttt{array}.

hhline Finer control over horizontal rules in tables. Requires \texttt{array}.

longtable Multi-page tables. (Does not require \texttt{array}, but it uses the extended features if both are loaded.)

tabularx Defines a \texttt{tabularx} environment that is similar to \texttt{tabular*} but it modifies the column widths, rather than the inter-column space, to achieve the desired table width.

afterpage Place text after the current page.

bm Access bold math symbols.

enumerate Extended version of the \texttt{enumerate} environment.

fontsml Package and test file for producing ‘font samples’.
\texttt{ftnright} Place all footnotes in the right-hand column in two-column mode.

\texttt{indentfirst} Indent the first paragraph of sections, etc.

\texttt{layout} Show the page layout defined by the current document class.

\texttt{multicol} Typeset text in columns, with the length of the columns ‘balanced’.

\texttt{rawfonts} Preload fonts using the old internal font names of \LaTeX{} 2.09. See Section 6.2.

\texttt{somedefs} Selective handling of package options. (Used by the rawfonts package.)

\texttt{showkeys} Prints the ‘keys’ used by \texttt{\textbackslash label}, \texttt{\textbackslash ref}, \texttt{\textbackslash cite} etc.; useful whilst drafting.

\texttt{theorem} Flexible declaration of ‘theorem-like’ environments.

\texttt{varioref} ‘Smart’ handling of page references.

\texttt{verbatim} Flexible extension of the verbatim environment.

\texttt{xr} Cross reference other ‘external’ documents.

\texttt{xspace} ‘Smart space’ command that helps you to avoid the common mistake of missing spaces after command names.

3 Commands

This section describes the new commands available in \LaTeX{} 2ε. They are covered in more detail in \textit{\LaTeX{}: A Document Preparation System} and in \textit{The \LaTeX{} Companion}.

3.1 Initial commands

Initial commands can appear only before the \texttt{\textbackslash documentclass} line.

\begin{Verbatim}
\begin{filecontents}{⟨file-name⟩}
⟨file-contents⟩
\end{filecontents}
\end{Verbatim}

The \texttt{filecontents} environment is intended for bundling within a single document file the contents of packages, options, or other files. When the document file is run through \LaTeX{} 2ε the body of this environment is written verbatim (preceded by a comment line) to a file whose name is given as the environment’s only argument. However, if that file already exists then nothing happens except for an information message.

Only normal ASCII text characters (7-bit visible text) should be included in a \texttt{filecontents} environment. Anything else, such as tab characters, form-feeds or 8-bit characters, should not be included in a \texttt{filecontents} environment.
Tabs and form feeds produce a warning, explaining that they are turned into spaces or blank lines, respectively. What happens to 8-bit characters depends on the \TeX installation and is in general unpredictable.

The \texttt{filecontents} environment is used for including \TeX files. For other plain text files (such as Encapsulated PostScript files), you should use the \texttt{filecontents*} environment which does not add a comment line.

These environments are allowed only before \texttt{\documentclass}. This ensures that any packages that have been bundled in the document are present when needed.

### 3.2 Preamble commands

The changes to the preamble commands are intentionally designed to make \TeX \textasciitilde 2\epsilon documents look clearly different from old documents. The commands should be used only before \texttt{\begin{document}}.

\begin{verbatim}
\documentclass [(option-list)] {⟨class-name⟩} [⟨release-date⟩]
\end{verbatim}

This command replaces the \TeX \textasciitilde 2.09 command \texttt{\documentstyle}.

There must be exactly one \texttt{\documentclass} command in a document; and it must come after the \texttt{filecontents} environments, if any, but before any other commands.

The \texttt{(option-list)} is a list of options, each of which may modify the formatting of elements which are defined in the \texttt{(class-name)} file, as well as those in all following \texttt{\usepackage} commands (see below).

The optional argument \texttt{(release-date)} can be used to specify the earliest desired release date of the class file; it should contain a date in the format \texttt{yyyy/mm/dd}. If a version of the class older than this date is found, a warning is issued.

For example, to specify a two-column article, using a version of \texttt{article.cls} released after June 1994, you specify:

\begin{verbatim}
\documentclass[twocolumn]{article}[1994/06/01]
\end{verbatim}

\begin{verbatim}
\documentstyle [(option-list)] {⟨class-name⟩}
\end{verbatim}

This command is still supported for compatibility with old files. It is essentially the same as \texttt{\documentclass} except that it invokes \TeX \textasciitilde 2.09 compatibility mode. It also causes any options in the \texttt{(option-list)} that are not processed by the class file to be loaded as packages after the class has been loaded. See Section 4 for more details on \TeX \textasciitilde 2.09 compatibility mode.

\begin{verbatim}
\usepackage [(option-list)] {⟨package-name⟩} [⟨release-date⟩]
\end{verbatim}

Any number of \texttt{\usepackage} commands is allowed. Each package file (as denoted by \texttt{(package-name)}) defines new elements (or modifies those defined in
the class file loaded by the \texttt{(class-name)} argument of the \texttt{documentclass} command. A package file thus extends the range of documents which can be processed.

The \texttt{(option-list)} argument can contain a list of options, each of which can modify the formatting of elements which are defined in this \texttt{(package-name)} file.

As above, \texttt{(release-date)} can contain the earliest desired release date of the package file in the format YYYY/MM/DD; if an older version of the package is found, a warning is issued.

For example, to load the \texttt{graphics} package for the \texttt{dvips} driver, using a version of \texttt{graphics.sty} released after June 1994, you write:

\begin{verbatim}
\usepackage[dvips]{graphics}[1994/06/01]
\end{verbatim}

Each package is loaded only once. If the same package is requested more than once, nothing happens in the second or following attempt unless the package has been requested with options that were not given in the original \texttt{usepackage}. If such extra options are specified then an error message is produced. See Section 6 how to resolve this problem.

As well as processing the options given in the \texttt{(option-list)} of the \texttt{usepackage} command, each package processes the \texttt{(option-list)} of the \texttt{documentclass} command as well. This means that any option which should be processed by every package (to be precise, by every package that specifies an action for it) can be specified just once, in the \texttt{documentclass} command, rather than being repeated for each package that needs it.

\texttt{\textbackslash listfiles}

If this command is placed in the preamble then a list of the files read in (as a result of processing the document) will be displayed on the terminal (and in the log file) at the end of the run. Where possible, a short description will also be produced.

\textit{Warning:} this command will list only files which were read using \LaTeX\ commands such as \texttt{\textbackslash input\{\textbackslash file\}} or \texttt{\textbackslash include\{\textbackslash file\}}. If the file was read using the primitive \TeX\ syntax \texttt{\textbackslash input file} (without \{} \texttt{\textbackslash}} braces around the file name) then it will not be listed; failure to use the \LaTeX\ form with the braces can cause more severe problems, possibly leading to overwriting important files, so always put in the braces.

\texttt{\textbackslash setcounter\{errorcontextlines\}\{\textbackslash num\}}

\TeX\ 3 introduced a new primitive \texttt{\textbackslash errorcontextlines} which controls the format of error messages. \LaTeX\ \texttt{2\epsilon} provides an interface to this through the standard \texttt{\textbackslash setcounter} command. As most \LaTeX\ users do not want to see the internal definitions of \LaTeX\ commands each time they make an error, \LaTeX\ \texttt{2\epsilon} sets this to $-1$ by default.
3.3 Document structure

The book document class introduces new commands to indicate document structure.

\begin{itemize}
  \item \frontmatter
  \item \mainmatter
  \item \backmatter
\end{itemize}

These commands indicate the beginning of the front matter (title page, table of contents and prefaces), main matter (main text) and back matter (bibliography, indexes and colophon).

3.4 Definitions

In \LaTeX, commands can have both mandatory and optional arguments, for example in:

\begin{verbatim}
\documentclass[11pt]{article}
\end{verbatim}

the 11pt argument is optional, whereas the article class name is mandatory.

In \LaTeX\ 2.09 users could define commands with arguments, but these had to be mandatory arguments. With \LaTeX\ 2ε, users can now define commands and environments which also have one optional argument.

\begin{verbatim}
\newcommand \newcommand* \renewcommand \renewcommand*
\end{verbatim}

These commands have a new, second, optional argument; this is used for defining commands which themselves take one optional argument. This new argument is best introduced by means of a simple (and hence not very practical) example:

\begin{verbatim}
\newcommand\example[2][YYY]\{\text{Mandatory arg: #2; Optional arg: #1.}\}
\end{verbatim}

This defines \example to be a command with two arguments, referred to as #1 and #2 in the \{definition\}—nothing new so far. But by adding a second optional argument to this \newcommand (the [YYY]) the first argument (#1) of the newly defined command \example is made optional with its default value being YYY.

Thus the usage of \example is either:

\begin{verbatim}
\example{BBB}
\end{verbatim}

which prints:
Mandatory arg: BBB; Optional arg: YYY.

or:

\example[XXX]{AAA}

which prints:

Mandatory arg: AAA; Optional arg: XXX.

The default value of the optional argument is YYY. This value is specified as the \[(default)\] argument of the \newcommand that created \example.

As another more useful example, the definition:

\newcommand{\seq}[2][n]\{\brace #2_{0},\ldots,#2_{#1}\}\{rbrace}

means that the input $\seq{a}$ produces the formula \{a_0,\ldots,a_n\}, whereas the input $\seq[k]{x}$ produces the formula \{x_0,\ldots,x_k\}.

In summary, the command:

\newcommand {⟨cmd⟩} \[⟨num⟩] \[⟨default⟩] \{⟨definition⟩\}

defines \(cmd\) to be a command with \(num\) arguments, the first of which is optional and has default value \(default\).

Note that there can only be one optional argument but, as before, there can be up to nine arguments in total.

LaTeX also supports the creation of environments that have one optional argument. Thus the syntax of these two commands has been extended in the same way as that of \newcommand.

\providecommand {⟨cmd⟩} \[⟨num⟩] \[⟨default⟩] \{⟨definition⟩\}

This takes the same arguments as \newcommand. If \(cmd\) is already defined then the existing definition is kept; but if it is currently undefined then the effect of \providecommand is to define \(cmd\) just as if \newcommand had been used.

All the above five ‘defining commands’ now have *-forms that are usually the better form to use when defining commands with arguments, unless any of these arguments is intended to contain whole paragraphs of text. Moreover, if you ever do find yourself needing to use the non-star form then you should ask whether that argument would not better be treated as the contents of a suitably defined environment.

The commands produced by the above five ‘defining commands’ are now robust.
3.5 Boxes

These next three commands for making LR-boxes all existed in \LaTeX{} 2.09. They have been enhanced in two ways.

\begin{itemize}
  \item \texttt{\makebox \[ \langle width \rangle \] \[ \langle pos \rangle \] \{ \langle text \rangle \}}
  \item \texttt{\framebox \[ \langle width \rangle \] \[ \langle pos \rangle \] \{ \langle text \rangle \}}
  \item \texttt{\savebox \{ \langle cmd \rangle \} \[ \langle width \rangle \] \[ \langle pos \rangle \] \{ \langle text \rangle \}}
\end{itemize}

One small but far-reaching change for \LaTeX{} 2ε is that, within the \texttt{\langle width \rangle} argument only, four special lengths can be used. These are all dimensions of the box that would be produced by using simply \texttt{\mbox{\{ \langle text \rangle \}}}:

\begin{itemize}
  \item \texttt{\height} its height above the baseline;
  \item \texttt{\depth} its depth below the baseline;
  \item \texttt{\totalheight} the sum of \texttt{\height} and \texttt{\depth};
  \item \texttt{\width} its width.
\end{itemize}

Thus, to put ‘hello’ in the centre of a box of twice its natural width, you would use:

\begin{verbatim}
\makebox[2\width]{hello}
\end{verbatim}

Or you could put \texttt{f} into a square box, like this:\texttt{f}

\begin{verbatim}
\framebox{\makebox[\totalheight]{\itshape f/}}
\end{verbatim}

Note that it is the total width of the framed box, including the frame, which is set to \texttt{\totalheight}.

The other change is a new possibility for \texttt{\langle pos \rangle}: \texttt{s} has been added to \texttt{t} and \texttt{r}. If \texttt{\langle pos \rangle} is \texttt{s} then the text is stretched the full length of the box, making use of any ‘rubber lengths’ (including any inter-word spaces) in the contents of the box. If no such ‘rubber length’ is present, an ‘underfull box’ will probably be produced.

\begin{verbatim}
\parbox \{\langle pos \rangle \} \[ \langle height \rangle \] \[ \langle inner-pos \rangle \] \{ \langle width \rangle \} \{ \langle text \rangle \}
\begin{minipage} \{\langle pos \rangle \} \[ \langle height \rangle \] \[ \langle inner-pos \rangle \] \{ \langle width \rangle \} \{ \langle text \rangle \}
\end{minipage}
\end{verbatim}

As for the box commands above, \texttt{\height}, \texttt{\width}, etc. may be used in the \texttt{\[ \langle height \rangle \]} argument to denote the natural dimensions of the box.

The \texttt{\langle inner-pos \rangle} argument is new in \LaTeX{} 2ε. It is the vertical equivalent to the \texttt{\langle pos \rangle} argument for \texttt{\makebox}, etc, determining the position of \texttt{\langle text \rangle} within the box. The \texttt{\langle inner-pos \rangle} may be any one of \texttt{t}, \texttt{b}, \texttt{c}, or \texttt{s}, denoting top, bottom, centered, or ‘stretched’ alignment respectively. When the \texttt{\langle inner-pos \rangle} argument
is not specified, $\LaTeX$ gives it same value as $\langle pos \rangle$ (this could be the latter's default value).

\begin{lrbox}{⟨cmd⟩}
⟨text⟩
\end{lrbox}

This is an environment which does not directly print anything. Its effect is to save the typeset ⟨text⟩ in the bin ⟨cmd⟩. Thus it is like \sbox{⟨cmd⟩}{⟨text⟩}, except that any white space before or after the contents ⟨text⟩ is ignored.

This is very useful as it enables both the \verb command and the \verbatim environment to be used within ⟨text⟩.

It also makes it possible to define, for example, a ‘framed box’ environment. This is done by first using this environment to save some text in a bin ⟨cmd⟩ and then calling \fbox{\usebox{⟨cmd⟩}}.

The following example defines an environment, called fmpage, that is a framed version of minipage.

\newsavebox{fmbox}
\newenvironment{fmpage}[1]{\begin{lrbox}{fmbox}\begin{minipage}{#1}}{\end{minipage}\end{lrbox}\fbox{\usebox{fmbox}}}

3.6 Measuring things

The first of these next commands was in $\LaTeX$ 2.09. The two new commands are the obvious analogues.

\settowidth{⟨length-cmd⟩}{ ⟨br text⟩}
\settoheight{⟨length-cmd⟩}{ ⟨br text⟩}
\settodepth{⟨length-cmd⟩}{ ⟨br text⟩}

3.7 Line endings

The command \\, which is used to indicate a line-end in various places, is now a robust command when used within arguments such as section titles.

Also, because it is often necessary to distinguish which type of line is to be ended, we have introduced the following new command; it has the same argument syntax as that of \\.

\tabularnewline \[⟨vertical-space⟩]\]

One example of its use is when the text in the last column of a tabular environment is set with \raggedright; then \tabularnewline can be used to indicate the end of a row of the tabular, whilst \\ will indicate the end of a
line of text in a paragraph within the column. This command can be used in the \texttt{array} environment as well as \texttt{tabular}, and also the extended versions of these environments offered by the \texttt{array} and \texttt{longtable} packages in the tools collection.

### 3.8 Controlling page breaks

Sometimes it is necessary, for a final version of a document, to 'help' \LaTeX break the pages in the best way. \LaTeX 2.09 had a variety of commands for this situation: \texttt{\clearpage}, \texttt{\pagebreak} etc. \LaTeX 2ε provides, in addition, commands which can produce longer pages as well as shorter ones.

\begin{verbatim}
\enlargethispage \langle size \rangle
\enlargethispage* \langle size \rangle
\end{verbatim}

These commands increase the height of a page (from its normal value of \texttt{\textheight}) by the specified amount \langle size \rangle, a rigid length. This change affects only the current page.

This can be used, for example, to allow an extra line to be fitted onto the page or, with a negative length, to produce a page shorter than normal.

The star form also shrinks any vertical white space on the page as much as possible, so as to fit the maximum amount of text on the page.

These commands do not change the position of the footer text; thus, if a page is lengthened too far, the main text may overprint the footer.

### 3.9 Floats

There is a new command, \texttt{\suppressfloats}, and a new 'float specifier'. These will enable people to gain better control of \LaTeX’s float placement algorithm.

\begin{verbatim}
\suppressfloats \langle placement \rangle
\end{verbatim}

This command stops any further floating environments from being placed on the current page. With an optional argument, which should be either \texttt{t} or \texttt{b} (not both), this restriction applies only to putting further floats at the top or at the bottom. Any floats which would normally be placed on this page are placed on the next page instead.

The extra float location specifier: \texttt{!}

This can be used, along with at least one of \texttt{h}, \texttt{t}, \texttt{b} and \texttt{p}, in the location optional argument of a float.

If a \texttt{!} is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
• all explicit restrictions on the amount of space on a text page which may
be occupied by floats or must be occupied by text.

The mechanism will, however, still attempt to ensure that pages are not overfull
and that floats of the same type are printed in the correct order.

Note that its presence has no effect on the production of float pages.

A \ specifier overrides the effect of any suppressfloats command for this
particular float.

3.10 Font changing: text

The font selection scheme used in \LaTeXe differs a lot from that used in
\LaTeX 2.09. In this section, we give a brief description of the new commands.
A more detailed description with examples is given in The \LaTeX Companion,
and the interface for class- and package-writers is described in \LaTeXe Font
Selection.

\begin{tabular}{|l|}
  \hline
  \texttt{\rmfamily} & \texttt{\sffamily} & \texttt{\ttfamily} & \texttt{\mdseries} & \texttt{\bfseries} & \texttt{\upshape} & \texttt{\itshape} & \texttt{\slshape} & \texttt{\scshape} \\
  \hline
\end{tabular}

These are font commands whose use is the same as the commands \texttt{\rm}, \texttt{\bf}, etc.
The difference is that each command changes just one attribute of the font (the
attribute changed is part of the name). One result of this is that, for example,
\texttt{\bfseries\itshape} produces both a change of series and a change of shape, to
give a bold italic font.

\begin{tabular}{|l|}
  \hline
  \texttt{\textrm{\{}text\}} & \texttt{\textsf{\{}text\}} & \texttt{\texttt{\{}text\}} & \texttt{\textmd{\{}text\}} & \texttt{\textbf{\{}text\}} & \texttt{\textup{\{}text\}} & \texttt{\textit{\{}text\}} & \texttt{\textsl{\{}text\}} & \texttt{\textsc{\{}text\}} & \texttt{\textemph{\{}text\}} \\
  \hline
\end{tabular}

These are one-argument commands; they take as an argument the text which
is to be typeset in the particular font. They also automatically insert italic
corrections where appropriate; if you do not like the result, you can add an italic
correction with \texttt{\textbackslash{}\textbackslash{}corr} or remove it with \texttt{\textbackslash{}nocorr}. The \texttt{\textbackslash{}corr} should always be
the first or last thing within the \texttt{\{}text\} argument.
3.11 Font changing: math

Most of the fonts used within math mode do not need to be explicitly invoked; but to use letters from a range of fonts, the following class of commands is provided.

\begin{verbatim}
\mathr{⟨letters⟩}
\mathn{⟨letters⟩}
\mathc{⟨letters⟩}
\mathb{⟨letters⟩}
\maths{⟨letters⟩}
\matht{⟨letters⟩}
\mathi{⟨letters⟩}
\end{verbatim}

These are also one-argument commands which take as an argument the letters which are to be typeset in the particular font. The argument is processed in math mode so spaces within it will be ignored. Only letters, digits and accents have their font changed, for example $\textbf{\tilde{A} \times 1}$ produces $\tilde{A} \times 1$.

3.12 Ensuring math mode

\begin{verbatim}
\ensuremath{⟨math commands⟩}
\end{verbatim}

In \LaTeX{} 2.09, if you wanted a command to work both in math mode and in text mode, the suggested method was to define something like:

\begin{verbatim}
\newcommand{\Gp}{\mbox{$G_p$}}
\end{verbatim}

Unfortunately, the \texttt{mbox} stops $\Gp$ changing size correctly in (for instance) subscripts or a fraction.

In \LaTeX{} 2ε you can define it thus:

\begin{verbatim}
\newcommand{\Gp}{\ensuremath{G_p}}
\end{verbatim}

Now $\Gp$ will work correctly in all contexts.

This is because the \texttt{ensuremath} does nothing, producing simply $G_p$, when $\Gp$ is used within math mode; but it ensures that math mode is entered (and exited) as required when $\Gp$ is used in text mode.

3.13 Setting text superscripts

\begin{verbatim}
\textsuperscript{⟨text⟩}
\end{verbatim}

In \LaTeX{} 2.09 textual superscripts such as footnote markers were produced by internally entering math mode and typesetting the number as a math superscript. This normally looked fine since the digits in math fonts are the same as...
those in text fonts when Computer Modern fonts are used. But when a different
document font (such as Times) is selected, the results look rather strange. For
this reason the command \textsuperscript has been introduced which type-
sets its argument in the current text font, in a superscript position and in the
correct size.

3.14 Text commands: all encodings

One of the main differences between \LaTeXe and \LaTeX 2.09 is that \LaTeXe can deal with fonts in arbitrary encodings. (A font encoding is the sequence
of characters in the font—for example a Cyrillic font would have a different
encoding from a Greek font.)

The two major font encodings that are used for Latin languages such as English
or German are OT1 (Donald Knuth’s 7-bit encoding, which has been used during
most of \TeX’s lifetime) and T1 (the new 8-bit ‘Cork’ encoding).

\LaTeX 2.09 only supported the OT1 encoding, whereas \LaTeXe has support
for both OT1 and T1 built-in. The next section will cover the new commands
which are available if you have T1-encoded fonts. This section describes new
commands which are available in all encodings.

Most of these commands provide characters which were available in \LaTeX 2.09
already. For example \textemdash gives an ‘em dash’, which was available in
\LaTeX 2.09 by typing ---. However, some fonts (for example a Greek font) may
not have the --- ligature, but you will still be able to access an em dash by
typing \textemdash.

\texttt{\textcircled{⟨text⟩}}

This command is used to build ‘circled characters’ such as \copyright. For
example \textcircled{a} produces @.

\texttt{\textcompwordmark}

This command is used to separate letters which would normally ligature. For
example ‘fi’ is produced with f\textcompwordmark i. Note that the ‘f’ and
‘i’ have not ligatured to produce ‘fi’. This is rarely useful in English (‘shelfful’
is a rare example of where it might be used) but is used in languages such as
German.
\textvisiblespace

This command produces a ‘visible space’ character ‘\ ’. This is sometimes used in computer listings, for example ‘type hello\ world’.

\textemdash \textendash \textexclamdown \textquestiondown \textquotedblleft \textquotedblright \textquoteleft \textquoteright

These commands produce characters which would otherwise be accessed via ligatures:

\begin{verbatim}
ligature  character command
---  \textemdash
--  \textendash
!\textexclamdown
?\textquestiondown
\textquotedblleft
\textquotedblright
\textquoteleft
\textquoteright
\end{verbatim}

The reason for making these characters directly accessible is so that they will work in encodings which do not have these characters.

\textbullet \textperiodcentered

These commands allow access to characters which were previously only available in math mode:

\begin{verbatim}
math command  character  text command
\bullet  \textbullet
\cdot  \textperiodcentered
\end{verbatim}

\textbackslash \textbar \textless \textgreater

These commands allow access to ASCII characters which were only available in verbatim or math mode:

\begin{verbatim}
math command  character  text command
\backslash  \textbackslash
\mid  \textbar
<  \textless
>  \textgreater
\end{verbatim}

\textasciicircum \textasciitilde

These commands allow access to ASCII characters which were previously only available in verbatim:
These commands provide the ‘registered trademark’ (R) and ‘trademark’ (TM) symbols.

### 3.15 Text commands: the T1 encoding

The OT1 font encoding is fine for typesetting in English, but has problems when typesetting other languages. The T1 encoding solves some of these problems, by providing extra characters (such as ‘eth’ and ‘thorn’), and it allows words containing accented letters to be hyphenated (as long as you have a package like `babel` which allows for non-American hyphenation).

This section describes the commands you can use if you have the T1 fonts. To use them, you need to get the ‘ec fonts’, or the T1-encoded PostScript fonts, as used by `psnfss`. All these fonts are available by anonymous ftp in the Comprehensive TeX Archive, and are also available on the CD-ROMs `4all TeX` and `TEX Live` (both available from the TeX Users Group).

You can then select the T1 fonts by saying:

```
\usepackage[T1]{fontenc}
```

This will allow you to use the commands in this section.

*Note:* Since this document must be processable on any site running an up-to-date TeX, it does not contain any characters that are present only in T1-encoded fonts. This means that this document cannot show you what these glyphs look like! If you want to see them then run `ltx` on the document `fontsamp1` and respond ‘cmr’ when it prompts you for a family name.

This command produces an ‘ogonek’ accent.

These commands produce characters ‘eth’, ‘dbar’, ‘eng’, and ‘thorn’.

These commands produce various sorts of quotation mark. Rough representations of them are: `<a> a` “a”, ‘a’ and “a”.

There are therefore some extra short-form ligatures available for use in documents.
ments that will only be used with T1-encoded fonts.

The guillemets \guillemotleft and \guillemotright\(^1\) can be obtained by typing << and >> and \textquotedblleft by typing ,.

Also, unlike the unexpected results with OT1-encoded fonts, < and > will produce < and >.

Note also that the single character " will no longer produce " but rather \textquotedbl.

### 3.16 Logos

\LaTeX\(\L_A\TeX\) is still the 'main' logo command, but if you need to refer to the new features, you can write \LaTeXe (producing 'L\TeX 2\ε').

### 3.17 Picture commands

\begin{verbatim}
\qbezier[(N)]((AX),(AY))((BX),(BY))((CX),(CY))
\bezier((N))((AX),(AY))((BX),(BY))((CX),(CY))
\end{verbatim}

The \qbezier command can be used in picture mode to draw a quadratic Bezier curve from position ((AX),(AY)) to ((CX),(CY)) with control point ((BX),(BY)). The optional argument \langle N\rangle gives the number of points on the curve.

For example, the diagram:

is drawn with:

\begin{verbatim}
\begin{picture}(50,50)
\thicklines
\qbezier(0,0)(0,50)(50,50)
\qbezier[20](0,0)(50,0)(50,50)
\thinlines
\put(0,0){\line(1,1){50}}
\end{picture}
\end{verbatim}

The \bezier command is the same, except that the argument \langle N\rangle is not optional. It is provided for compatibility with the \TeX 2.09 \texttt{bezier} document style option.

\(^1\)We apologise once again for maintaining Adobe’s enormous solipsism (sic) of confusing a diving bird with punctuation marks!
3.18 Old commands

\samepage

The \samepage command still exists but is no longer being maintained. This is because it only ever worked erratically; it does not guarantee that there will be no page-breaks within its scope; and it can cause footnotes and marginals to be wrongly placed.

We recommend using \enlargethispage in conjunction with page-break commands such as \newpage and \pagebreak to help control page breaks.

\SLiTeX

Since S\LaTeX no longer exists, the logo is no longer defined in the \LaTeX kernel. A suitable replacement is \textsc{S\LaTeX}. The S\LaTeX logo is defined in \LaTeX 2.09 compatibility mode.

\mho \Join \Box \Diamond \leadsto \sqsubset \sqsupset \lhd \unlhd \rhd \unrhd

These symbols are contained in the \LaTeX symbol font, which was automatically loaded by \LaTeX 2.09. However, \TeX has room for only sixteen math font families; thus many users discovered that they ran out. Because of this, \LaTeX does not load the \LaTeX symbol font unless you use the latexsym package.

These symbols are also made available, using different fonts, by the amsfonts package, which also defines a large number of other symbols. It is supplied by the American Mathematical Society.

The latexsym package is loaded automatically in \LaTeX 2.09 compatibility mode.

4 \LaTeX 2.09 documents

\LaTeX 2\epsilon can process (almost) any \LaTeX 2.09 document, by entering \LaTeX 2.09 compatibility mode. Nothing has changed, you run \LaTeX in the same way you always did, and you will get much the same results.

The reason for the ‘almost’ is that some \LaTeX 2.09 packages made use of low-level unsupported features of \LaTeX. If you discover such a package, you should find out if it has been updated to work with \LaTeX 2\epsilon. Most packages will still work with \LaTeX 2\epsilon—the easiest way to find out whether a package still works is to try it!

\LaTeX 2.09 compatibility mode is a comprehensive emulation of \LaTeX 2.09, but at the cost of time. Documents can run up to 50% slower in compatibility mode than they did under \LaTeX 2.09. In addition, many of the new features of \LaTeX 2\epsilon are not available in \LaTeX 2.09 compatibility mode.
4.1 Warning

This \LaTeX{} 2.09 compatibility mode is provided solely to allow you to process 2.09 documents, i.e. documents that were written (we hope, a long time ago) for a very old system and therefore could be processed by using a genuine antique \LaTeX{} 2.09 system.

This mode is therefore not intended to provide access to the enhanced features of \LaTeX{} ε. Thus it must not be used to process new documents which masquerade as 2.09 documents (i.e. they begin with \texttt{\documentstyle}) but which could not be processed using that genuine antique \LaTeX{} 2.09 system because they contain some new, \LaTeX{} ε-only, commands or environments.

To prevent such misuse of the system, and the consequent trouble it causes when such misleadingly encoded documents are distributed, the \LaTeX{} 2.09 compatibility mode turns off most of these new features and commands. Any attempt to use them will give you an error message and, moreover, many of them simply will not work, whilst others will produce unpredictable results. So don’t bother sending us any bug reports about such occurrences since they are intentional.

4.2 Font selection problems

When using compatibility mode, it is possible that you will find problems with font-changing commands in some old documents. These problems are of two types:

- producing error messages;
- not producing the font changes you expected.

In case of error messages it is possible that the document (or an old style file used therein) contains references to old internal commands which are no longer defined, see Section 6.2 for more information if this is the case.

One example of the unexpected is if you use one of the new style of math-mode font changing command as follows:

\$ \mathbf{xy} \ A \$

You may well find that this behaves as if you had put:

\$ \bf {xy} \ A \$

everything including the A coming out bold.

\LaTeX{} 2.09 allowed sites to customize their \LaTeX{} installation, which resulted in documents producing different results on different \LaTeX{} installations. \LaTeX{} ε no longer allows so much customization but, for compatibility with old documents, the local configuration file \texttt{latex209.cfg} is loaded every time \LaTeX{} ε enters \LaTeX{} 2.09 compatibility mode.
For example, if your site was customized to use the New Font Selection Scheme (NFSS) with the oldlfont option, then you can make \LaTeX\ 2\epsilon emulate this by creating a \texttt{latex209.cfg} file containing the commands:

\texttt{\ExecuteOptions{oldlfont}\RequirePackage{oldlfont}}

Similarly, to emulate NFSS with the newlfont option, you can create a \texttt{latex209.cfg} file containing:

\texttt{\ExecuteOptions{newlfont}\RequirePackage{newlfont}}

\section{Native mode}

To run an old document faster, and use the new features of \LaTeX\ 2\epsilon, you should try using \LaTeX\ 2\epsilon \textit{native mode}. This is done by replacing the command:

\texttt{\documentstyle[⟨options⟩,⟨packages⟩]{⟨class⟩}}

with:

\texttt{\documentclass[⟨options⟩]{⟨class⟩}}
\texttt{\usepackage{latexsym,⟨packages⟩}}

However, some documents which can be processed in \LaTeX\ 2.09 compatibility mode may not work in native mode. Some \LaTeX\ 2.09 packages will only work with \LaTeX\ 2\epsilon in 2.09 compatibility mode. Some documents will cause errors because of \LaTeX\ 2\epsilon’s improved error detection abilities.

But most \LaTeX\ 2.09 documents can be processed by \LaTeX\ 2\epsilon’s native mode with the above change. Again, the easiest way to find out whether your documents can be processed in native mode is to try it!

\section{Local modifications}

There are two common types of local modifications that can be done very simply. Do not forget that documents produced using such modifications will not be usable at other places (such documents are called ‘non-portable’).

One type of modification is the use of personal commands for commonly used symbols or constructions. These should be put into a package file (for example, one called \texttt{mymacros.sty}) and loaded by putting \texttt{\usepackage{mymacros}} in the document preamble.

Another type is a local document class that is very similar to one of the standard classes but contains some straightforward modifications such as extra environments, different values for some parameters, etc. These should be put into a class file: here we shall describe a simple method of constructing such a file using, as an example, a class called \texttt{larticle} that is very similar to the \texttt{article} class.

The class file called \texttt{larticle.cls} should (after the preliminary identification commands) start as follows:

\begin{verbatim}
\documentclass[⟨options⟩]{⟨class⟩}
\usepackage{latexsym,⟨packages⟩}
\end{verbatim}
\LoadClassWithOptions{article}

This command should be followed by whatever additions and changes you wish to make to the results of reading in the file \texttt{article.sty}.

The effect of using the above \texttt{LoadClassWithOptions} command is to load the standard class file \texttt{article} with whatever options are asked for by the document. Thus a document using your \texttt{larticle} class can specify any option that could be specified when using the standard \texttt{article} class; for example:

\documentclass[a4paper,twocolumn,dvips]{larticle}

6 Problems

This section describes some of the things which may go wrong when using \LaTeX\textsuperscript{2}, and what you can do about it.

6.1 New error messages

\LaTeX\textsuperscript{2} has a number of new error messages. Please also note that many error messages now produce further helpful information if you press \texttt{h} in response to the error prompt.

\begin{quote}
\textbf{Option clash for package \texttt{⟨package⟩}.}

The named package has been loaded twice with different options. If you enter \texttt{h} you will be told what the options were, for example, if your document contained:

\begin{verbatim}
\usepackage[foo]{fred}
\usepackage[baz]{fred}
\end{verbatim}

then you will get the error message:

Option clash for package fred.

and typing \texttt{h} at the ? prompt will give you:

The package fred has already been loaded with options:
[foo]
There has now been an attempt to load it with options:
[baz]
Adding the line:
\begin{verbatim}
\usepackage[foo,baz]{fred}
\end{verbatim}
to your document may fix this.
Try typing <return> to proceed.
\end{quote}
The cure is, as suggested, to load the package with both sets of options. Note that since \LaTeX\ packages can call other packages, it is possible to get a package option clash without explicitly requesting the same package twice.

**Command (command) not provided in base NFSS.**

The \textit{(command)} is not provided by default in \LaTeX\ 2ε. This error is generated by using one of the commands:

\begin{verbatim}
\mho \Join \Box \Diamond \leadsto \\
\sqsubset \sqsupset \lhd \unlhd \rhd \unrhd
\end{verbatim}

which are now part of the \texttt{latexsym} package. The cure is to add:

\begin{verbatim}
\usepackage{latexsym}
\end{verbatim}

in the preamble of your document.

**LaTeX2e command (command) in LaTeX 2.09 document.**

The \textit{(command)} is a \LaTeX\ 2ε command but this is a \LaTeX\ 2.09 document. The cure is to replace the command by a \LaTeX\ 2.09 command, or to run document in native mode, as described in Section 4.3.

**NFSS release 1 command \newmathalphabet found.**

The command \texttt{\newmathalphabet} was used by the New Font Selection Scheme Release 1 but it has now been replaced by \texttt{\DeclareMathAlphabet}, the use of which is described in \texttt{\LaTeX\ 2ε Font Selection}.

The best cure is to update the package which contained the \texttt{\newmathalphabet} command. Find out if there is a new release of the package, or (if you wrote the package yourself) consult \texttt{\LaTeX\ 2ε Font Selection} for the new syntax of font commands.

If there is no updated version of the package then you can cure this error by using the \texttt{newlfont} or \texttt{oldlfont} package, which tells \LaTeX\ which version of \texttt{\newmathalphabet} should be emulated.

You should use \texttt{oldlfont} if the document selects math fonts with syntax such as this:

\begin{verbatim}
{\cal A}, etc.
\end{verbatim}

Use \texttt{newlfont} if the document’s syntax is like this:

\begin{verbatim}
\cal{A}, etc.
\end{verbatim}
The `\verb` command has been begun but not ended on that line. This usually means that you have forgotten to put in the end-character of the `\verb` command.

**Illegal use of `\verb` command.**

The `\verb` command has been used inside the argument of another command. This has never been allowed in \LaTeX{}—often producing incorrect output without any warning—and so \LaTeX{} produces an error message.

### 6.2 Old internal commands

A number of \LaTeX{} 2.09 internal commands have been removed, since their functionality is now provided in a different way. See \LaTeX{} 2\epsilon for Class and Package Writers for more details of the new, supported interface for class and package writers.

```
\tenrm \elvrm \twlrm ...
\tenbf \elvbf \twlbf ...
\tensf \elvsf \twlsf ...
```

These commands provided access to the seventy fonts preloaded by \LaTeX{} 2.09. In contrast, \LaTeX{} 2\epsilon normally preloads at most fourteen fonts, which saves a lot of font memory; but a consequence is that any \LaTeX{} file which used the above commands to directly access fonts will no longer work.

Their use will usually produce an error message such as:

```
! Undefined control sequence.
1.5 \tenrm
```

The cure for this is to update the document to use the new font-changing commands provided by \LaTeX{} 2\epsilon; these are described in \LaTeX{} 2\epsilon Font Selection. If this is not possible then, as a last resort, you can use the `rawfonts` package, which loads the seventy \LaTeX{} 2.09 fonts and provides direct access to them using the old commands. This takes both time and memory. If you do not wish to load all seventy fonts, you can select some of them by using the `only` option to `rawfonts`. For example, to load only `tenrm` and `tenbf` you write:

```
\usepackage[only,tenrm,tenbf]{rawfonts}
```

The `rawfonts` package is distributed as part of the \LaTeX{} tools software, see Section 2.4.
6.3 Old files

One of the more common mistakes in running \LaTeX{} is to read in old versions of packages instead of the new versions. If you get an incomprehensible error message from a standard package, make sure you are loading the most recent version of the package. You can find out which version of the package has been loaded by looking in the log file for a line like:

```
Package: fred 1994/06/01 v0.01 Fred’s package.
```

You can use the \texttt{(release-date)} options to \texttt{\documentclass} and \texttt{\usepackage} to make sure that you are getting a suitably recent copy of the document class or package. This is useful when sending a document to another site, which may have out-of-date software.

6.4 Where to go for more help

If you can’t find the answer for your problem here, try looking in \texttt{\LaTeX{}: A Document Preparation System} or \texttt{The \LaTeX{} Companion}. If you have a problem with installing \LaTeX{}, look in the installation guide files which come with the distribution.

If this doesn’t help, contact your local \LaTeX{} guru or local \LaTeX{} mailing list.

If you think you’ve discovered a bug then please report it! First, you should find out if the problem is with a third-party package or class. If the problem is caused by a package or class other than those listed in Section 2 then please report the problem to the author of the package or class, not to the \LaTeX{}3 project team.

If the bug really is with core \LaTeX{} then you should create a short, self-contained document which exhibits the problem. You should run a recent (less than a year old) version of \LaTeX{} on the file and then run \LaTeX{} on \texttt{latexbug.tex}. This will create an error report which you should send, together with the sample document and log file, to the \LaTeX{} bugs address which can be found in the file \texttt{latexbug.tex} or \texttt{bugs.txt}.

7 Enjoy!

We certainly hope you will enjoy using the new standard \LaTeX{} but, if this is not possible, we hope that you will enjoy success and fulfillment as a result of the documents which it will help you to create.

If you find that the contribution of \LaTeX{} to your life is such that you would like to support the work of the project team, then please read Section 1.2 and discover practical ways to do this.
