addliga
(version 1.0)

Daniel Benjamin Miller
(dbmiller@dbmiller.org)

April 30, 2019

The fontspec¹ package enables use of OpenType and TrueType fonts in LuaL\TeX{} and \LaTeX{}. Though legacy TrueType fonts often include at least a partial set of ligatures, these, unlike those of OpenType fonts, are not accessible through fontspec’s usual mechanisms. The addliga package is designed to allow easy use of basic TrueType font ligatures in LuaL\TeX{} by adding an OpenType liga lookup table to the loaded font. (Nota bene: not all fonts will contain ligature support; addliga only adds support for existing ligatures.) The ligatures supported are ff, fi, ffi, fl and ffl. This package has been contributed to the public domain.

Basic Usage

\documentclass{…}
\usepackage{addliga}
\usepackage{fontspec}
\setmainfont{…}
\begin{document}
…
\end{document}
