*Please report any issues at https://github.com/aig-hagen/tikz_argumentation
1 Example

Figure 1: An exemplary AF created with the argumentation package.

```latex
\usepackage{argumentation}
\begin{figure}
\centering
\begin{af}
\argument{args1}{a}
\argument[right=of args1]{args2}{b}
\argument[right=of args2]{args3}{c}
\argument[right=of args3]{args4}{d}
\argument[right=of args4, incomplete]{args5}{e}
\argument[below=of args1]{args6}{f}
\argument[inactive, right=of args6]{args7}{g}
\argument[inactive, argin, right=of args7]{args8}{h}
\argument[right=of args8]{args9}{i}
\argument[right=of args9]{args10}{j}
\afname[left of=args1, yshift=-0.8cm, xshift=-0.2cm]{cap}{\textbf{F:}}
\selfattack{args1}
\dualattack{args1}{args6}
\dualattack[inactive]{args6}{args7}
\attack[inactive]{args8}{args7}
\attack[inactive]{args7}{args2}
\annotatedattack{args3}{args2}{$3$}
\attack[incomplete]{args4}{args5}
\attack{args5}{args10}
\attack{args10}{args9}
\attack{args9}{args4}
\support{args4}{args3}
\support{args9}{args3}
\end{af}
\caption{An exemplary AF created with the \texttt{argumentation} package.}
\label{fig:example}
\end{figure}
```
2 Documentation for Version 1.1 [2023/12/03]

In the following, we give an overview over the functionality of the argumentation package. In general, the functionality provided by this package is fully compatible with TikZ. Meaning every command from this package can be used inside the \texttt{tikzpicture} environment and every TikZ command or option can be used inside the \texttt{af} environment or in context of the argument nodes and attack edges.

2.1 Package Options

The \texttt{argumentation} package can be imported via the command
\begin{verbatim}
\usepackage{argumentation}
\end{verbatim}

Alternatively, one can also adjust the appearance by providing some package options via
\begin{verbatim}
\usepackage[⟨options⟩]{argumentation}
\end{verbatim}

The package provides the following \textit{optional} options to customize the look of the argumentation frameworks.

\begin{itemize}
  \item \texttt{namestyle} Customizes the font of the argument names.
  \item \texttt{argumentstyle} Customizes the appearance of the argument nodes.
  \item \texttt{attackstyle} Customizes the appearance of the attack edges.
  \item \texttt{supportstyle} Customizes the appearance of the support edges.
\end{itemize}

In the following, we list the available options for each of the style parameters.

\texttt{namestyle=(option)}

The \texttt{namestyle} parameter accepts three different options

\begin{itemize}
  \item \texttt{normal} (default) The argument name is rendered normally.
  \item \texttt{italics} The argument name is rendered in \textit{italics}.
  \item \texttt{bold} The argument name is rendered in \texttt{bold}.
  \item \texttt{bolditalics} The argument name is rendered with \texttt{bold}.
  \item \texttt{monospace} The argument name is rendered in \texttt{monospace} font.
\end{itemize}

\texttt{argumentstyle=(option)}

The \texttt{argumentstyle} parameter accepts two options

\begin{itemize}
  \item \texttt{standard} (default) Standard style for the argument nodes.
\end{itemize}
attackstyle=⟨option⟩
The attackstyle parameter accepts two options

standard  (default) Standard style for the attack arrow tips.
large     Alternative style, arrow tip is larger and sharper.

supportstyle=⟨option⟩
The supportstyle parameter accepts three options

standard  (default) Standard style for the attack arrow tips.
dashed    Dashed arrow line, same tip.
double    Double arrow line and large flat tip.

You can override the argumentstyle, attackstyle and supportstyle parameters and set a custom style via the following commands respectively.
\setargumentstyle{⟨style⟩}
\setattackstyle{⟨style⟩}
\setsupportstyle{⟨style⟩}

where ⟨style⟩ is a list of Ti\text{KZ} style parameters.

2.2 The af Environment
The argumentation package provides an environment for creating abstract argumentation frameworks and bipolar argumentation frameworks in \LaTeX-documents.

\begin{af}[(options)]
(\text{environment content})
\end{af}

The argumentation package provides the \texttt{af} environment for creating abstract argumentation framework. The \texttt{af} environment extends the \texttt{tikzpicture} environment, meaning all Ti\text{KZ} commands can be used inside the \texttt{af} environment as well. Furthermore, all options for the \texttt{tikzpicture} environment can be used for the \texttt{af} environment as well. For instance, the option parameter \texttt{node distance}, which is set to \texttt{1cm} per default.

If you want to create an argumentation framework with limited space available, you can provide one of the following predefined options for the environment. This is especially useful for two-column layout documents.

- \texttt{tiny node distance} is set to 0.35\texttt{cm} and nodes are smaller.
- \texttt{small node distance} is set to 0.55\texttt{cm} and nodes are smaller.
Example 1 Consider the two AFs in Figure 2 created with the \textit{small} and \textit{tiny} option respectively.

![AF diagrams](image)

(a) An exemplary AF created with the \textit{small} option set.  
(b) An exemplary AF created with the \textit{tiny} option set.

Figure 2: Two AFs with smaller nodes, created by using the \textit{small} and \textit{tiny} options of the \texttt{af} environment.

While the following commands are intended to be used inside the \texttt{af} environment, they can also be used inside the \texttt{tikzpicture} environment.

2.3 Arguments

Arguments can be created with the following command

\[ \texttt{\textbackslash argument\{\langle id\rangle\}\{\langle name\rangle\}} \]

\(\langle id\rangle\) is the identifier of the new argument  
\(\langle name\rangle\) is the displayed name of the argument

To create an argument, you must provide a unique identifier and the name to be displayed in the picture. The \(\langle id\rangle\) of an argument is then referred to when creating attacks as well as for the relative positioning of other arguments.

2.3.1 Relative Positioning

This package supports relative placement of the arguments via the TikZ-library \texttt{positioning}. The relative positioning information is provided as an optional parameter via

\[ \texttt{\textbackslash argument\{\langle dir\rangle=of\ {\langle arg_id\rangle}\{\langle id\rangle\}\{\langle name\rangle\}} \]

\(\langle dir\rangle\) has to be one of: \textit{right}, \textit{left}, \textit{below} and \textit{above}  
\(\langle arg_id\rangle\) is the identifier of another argument

Additionally, you can adjust the horizontal/vertical position of an argument via the options \texttt{xshift=\langle v\rangle} and \texttt{yshift=\langle v\rangle}. The value \(\langle v\rangle\) is the horizontal/vertical offset, e.g., \texttt{5pt}, \texttt{-3ex} or \texttt{0.2cm}. 

5
2.3.2 Argument Styling

Furthermore, you can provide optional parameters to adjust the style of the argument node. For that you can use all TikZ-style options and additionally the following predefined style parameters:

- **inactive** The argument is displayed with grey outline and text.
- **incomplete** The argument is displayed with a dotted outline.
- **invisible** The argument node is completely transparent.
- **argin** The argument is displayed with green background color.
- **argout** The argument is displayed with red background color.
- **argundec** The argument is displayed with cyan background color.

2.4 Attacks

Attacks between two arguments can be created with the command

\[ \text{\texttt{\textbackslash attack\{⟨arg1⟩\}\{⟨arg2⟩\}}}, \]

where \texttt{⟨arg1⟩} and \texttt{⟨arg2⟩} are the identifiers of two previously defined arguments.
2.4.1 Attack Styling

To customize an attack you can provide additional optional parameters:

- **inactive** The attack is displayed in grey.
- **incomplete** The attack is displayed with a dotted line.
- **invisible** The attack is completely transparent.
- **selfattack** Use if source and target of the attack are the same node.
- **bend right** The attack arrow is bent to the right.
  
  Can additionally provide the angle, e.g., `bend right=40`.

- **bend left** The attack arrow is bent to the left. Can also provide an angle.

Of course, all TikZ style parameters can be used here as well.

**Example 3**

\begin{af}
\argument{arg1}{a}
\argument[right=of arg1]{arg2}{b}
\argument[right=of arg2]{arg3}{c}
\argument[right=of arg3]{arg4}{d}
\attack{arg1}{arg2}
\attack[bend right]{arg2}{arg3}
\attack[bend left=10,inactive]{arg3}{arg4}
\end{af}

Additionally, there is a shortcut for creating a symmetric attack between two arguments with `\dualattack{\langle arg1 \rangle}{\langle arg2 \rangle}`

and a shortcut for a self-attack for an argument with `\selfattack{\langle arg1 \rangle}`

For both commands, you can use the same optional parameters as for the `\attack` command.

**Example 4**

\begin{af}
\argument{arg1}{a}
\argument[right=of arg1]{arg2}{b}
\end{af}
2.5 Supports

You can create a support relation between two arguments with the command

\support{⟨arg1⟩}{⟨arg2⟩}

where ⟨arg1⟩ and ⟨arg2⟩ are the identifiers of two previously defined arguments. The support arrow use the same tip as the attack arrows, but have a perpendicular mark to distinguish them from attacks. Supports can be customized in the same way as attacks.

Example 5

\begin{af}
\argument{arg1}{a}
\argument[right=of arg1]{arg2}{b}
\argument[right=of arg2]{arg3}{c}
\support{arg1}{arg2}
\support[bend right]{arg2}{arg3}
\end{af}

2.6 Annotated Attacks

Many extensions of the original abstract argumentation framework rely on attacks with an associated value. This may, for instance, be probabilities in the case of probabilistic argumentation frameworks or numerical weights in the case of weighted argumentation frameworks. These annotations can be added manually via TikZ or via the following command

\annotatedattack{⟨arg1⟩}{⟨arg2⟩}{⟨value⟩}
where \langle arg1 \rangle and \langle arg2 \rangle are the identifiers of two previously defined arguments and \langle value \rangle is the number or string that should be annotated to the attack. With this command, the annotation is placed above the attack arrow.

Example 6

\begin{af}
  \argument{arg1}{a}
  \argument[right=of arg1]{arg2}{b}
  \argument[right=of arg2]{arg3}{c}
  \annotatedattack{arg1}{arg2}{$x$}
  \annotatedattack[bend right]{arg2}{arg3}{$0.6$}
\end{af}

2.7 Further Commands

If you want to display an identifier for your argumentation framework in the picture, you can use the command

\begin{verbatim}
\afname{\langle id \rangle}{\langle name \rangle}
\end{verbatim}

where \langle id \rangle is an identifier for the created node and \langle name \rangle is the text displayed in the picture. Additionally, positioning information can be provided via the optional parameters.

To create an annotation, e.g., an acceptance condition or a weight, next to an argument, the following command can be used.

\begin{verbatim}
\annotation{\langle arg_id \rangle}{\langle text \rangle}
\end{verbatim}

where \langle arg_id \rangle is the identifier of some argument and \langle text \rangle is the text to be displayed. Additionally, positioning information, via xshift or yshift, can be provided via the optional parameters.

Example 7

\begin{verbatim}
\begin{af}
  \argument{arg1}{a}
  \argument[right=of arg1]{arg2}{b}
  \afname[left=of arg1]{caption}{$F:$}
  \annotation[yshift=-0.4cm,xshift=0.4cm]{arg2}{$\neg a$}
\end{af}
\end{verbatim}
\text{attack}\{\arg_1}\{\arg_2\}
\end{af}

F : \quad a \rightarrow b

\neg a
3 Version History

[v1.0 2023/11/05]
- First Version.

[v1.1 2023/12/03]
- Adjusted standard styles.
- Added command for creating annotated attacks.
- Now only provides one environment, which can be parameterised.
- Changed option management to pgfkeys.
- Updated and improved documentation.
