1 Introduction

The list implementation in $\text{\LaTeX} 2_{\epsilon}$ serves a dual purpose: it implements real lists such as `itemize` or `enumerate`, but it is also used as the basis for vertical blocks, i.e., to specify the vertical spacing and paragraph handling after such block, e.g., in environments like `center`, `quote`, `verbatim`, or in the theorem environments. They are all implemented as “trivial” lists with a single (hidden) item.

While this was convenient to get a consistent layout using a single implementation it is not adequate if it comes to interpreting the structure of a document, because environments based on `trivlist` should not advertise themselves as being a “list” — after all, from a semantic point of view they aren’t lists.

The approach taking here is therefore to offer separate template types: `block` (horizontally or vertically oriented data that needs some handling at the start and the end), `para` (that deals with different paragraph layouts), `list` (that handles list related parameters, and `item` (for item layouts and handling).

To address the independent aspects we have the template type `blockenv` that ties them together as necessary when we build document level environments.

For example, a `quote` environment would make use of a (display) `block` and some `para` instance while a standard `enumerate` would make use of a display `block`, a `list`, and an `item` and a `para` instance. An inline list (like `enumerate*` from the `enumitem` package) would be using the same `list` instance but a different (horizontally oriented) `block` instance build from a different template.

Instead of a `list` instance to handle the inner structure of the environment one can use an instance of the type `captionedtext` to produce a display environment with an associated heading/caption, such as a theorem-like environment or a proof environment. Further possibilities (not yet implemented) are templates for producing boxed text or formal quotes like those produced by the `csquotes` package.

2 Template types and templates for blocks and lists

2.1 Template types

2.1.1 The template type ‘`blockenv`’

Arg: 1 key/value list to alter the default parameters of the template instances used by the particular `blockenv` environment

Arg: 2 Boolean to suppress a number in case this environment normally produces a numbered caption

Arg: 3 Caption/heading/note text supplied from the document, in case this environment supports a caption (most don’t), otherwise `\NoValue`

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption (most don’t), otherwise `\NoValue`

Semantics:

This template type is used to implement document-level environments. It defines a `block` instance to handle the layout at the “edge” of the environment data, possibly some paragraph setup through a `para` instance, potentially an “inner” instance for more complicated environments (such as lists), and possibly some additional setup code for certain environments.

Arguments 2–4 are passed to the instance handling the inner structure, e.g., `list` or `captionedtext` which may or may not make use of it.

It also defines how the `blockenv` behaves with respect to nesting, e.g., does it change when nested and if so how many levels of nesting are supported, etc.

Finally, the template type defines how it appears in a tagged PDF document, what tag names are used, how they are role-mapped and whether it adds additional attributes, etc.

2.1.2 The template type ‘block’

Arg: 1 key/value list to alter the default block parameters

Semantics:

Handle the layout aspects of a block of data. In case of a “display” block (i.e., vertically oriented) the spacing and page breaking as well as the handling if the block starts a paragraph or ends one, that is, if text is immediately following the block without being separated by an empty line, then this text is considered to be in the same paragraph as the block.

In case of a horizontally oriented block it covers any special handling at the start and end of the block, e.g., extra spacing, prohibiting or encouraging line breaks, and so forth.

2.1.3 The template type ‘para’

Arg: 1 key/value list to alter the default paragraph parameters

Semantics:

Sets up paragraph-specific parameters for H&J, e.g., to implement justification variations, the behavior of `\l` etc. The instances are used in higher-level templates, e.g., in a `block`.

2.1.4 The template type ‘list’

Arg: 1 key/value list to alter the default list parameters

Arg: 2 Boolean to suppress a number in case this list environment also produces a numbered heading/caption.

Arg: 3 Caption/heading/note text in case this environment supports a caption (lists normally don’t), otherwise `\NoValue`.

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

Handle the aspects related to list design, e.g., the use and formatting of counters, etc.

Standard $\text{\LaTeX} 2_{\epsilon}$ lists have no heading/caption, so arguments 2–4 are ignored in the standard `list` template. But special lists, such as a list of ingredients for a cookbook, might so there might be other templates that make use of them in the future.

Note that this template type does not cover block-related aspects, i.e., a list instance could be used both for a display list or for an inline list.

2.1.5 The template type ‘item’

Arg: 1 key/value list to alter the default item parameters.

Semantics:

A sub-type used as part of `list` to easily cover alternative layout for list items.

2.1.6 The template type ‘captionedtext’

Arg: 1 key/value list to alter the default `captionedtext` parameters.

Arg: 2 Boolean to suppress a number in case this environment also produces a numbered heading/caption.

Arg: 3 Caption/heading/note text as specified in the document for this text block; if not given then `\NoValue`. In case of theorem-like environments this is best to be considered as the explanatory note as the main part of the caption is fixed in that case.

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

Produces a text block with an associated caption/heading/note, e.g., a theorem-like environment would consist of a caption made from a fixed string, possibly a number and an optional user-specified note. There may not be a user-supplied caption text—the caption may consist of a fixed text only like “Lemma”.

Handles the aspects related to the caption design and typically supports keys for adjusting the layout of the body text, e.g., its font, etc.

Note that this template type does not cover block-related aspects, e.g., the dimensions of the display block are handled there.

2.1.7 The template type ‘thmstyle’

Arg: 1 key/value list to alter the default `thmstyle` parameters.

Arg: 2 Boolean to suppress a number in case this environment also produces a numbered heading/caption.

Arg: 3 Caption/heading text for this text block; if not given then `\NoValue`.

Arg: 4 Sub-caption/heading text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

A sub-type used as part of `captionedtext` when producing theorem-like environments. It does the bulk of the work and sets up most of the formatting. It has been separated out because many theorem-like environments use the same theorem layout and only differ in the fixed caption text they generate.

Not all templates of type `captionedtext` use `thmstyle` as an inner instance, e.g., proofs are implemented with a template that does everything necessary directly.

2.2 Templates

2.2.1 The `blockenv` template ‘std’

Attributes:

name (*tokenlist*) Name of the environment used in tracing and error messages.

tag-name (*tokenlist*) Name of the tag used for the block inside the PDF. If not explicitly given the name is defined by the **tagging-recipe**. Note that in case of **tagging-recipe=basic** no tag for the block is produced, so any key settings are ignored.
Default: `<empty>`

tag-attr-class (*tokenlist*) An explicit tag class attribute. Default: `<empty>`

tagging-recipe (*tokenlist*) Defines the way tagging is done. Currently the values **basic**, **standard**, **list**, and **standalone** are supported. The latter implies that the key **standalone** is set to true
Default: **standard**

standalone (*boolean*) If true, surrounds the environment implicitly with `\par` commands. Forced to true when **tagging-recipe** is **standalone**.
Default: **false**

transparent-level (*boolean*) Is this **blockenv** transparent for any blocks nested inside?
Default: **false**

early-legacy-code (*tokenlist*) Legacy setup code. This is executed after legacy defaults (from `\@listi`, `\@listii`, etc.) are used but before the block instance is called. At this point we may still be in horizontal mode! This means settings that alter paragraph parameters such as `\baselineskip` should **not** be used because they would affect preceding text! Use **late-legacy-code** for that instead in a display environment.
Default: `<empty>`

late-legacy-code (*tokenlist*) Legacy setup code. This is called after the **block** and **para** instances are processed but before the inner instance is called. At this point we are in vertical mode in a display environment and something like `\small` is not affecting preceding text.
Default: `<empty>`

block-instance (*tokenlist*) Part of the name of the **block** instance that is called. The full name has a `-<level>` appended.
Default: **std-display**

para-instance (*tokenlist*) Paragraph settings to use within the environment. If `<empty>` then the current (outer) values are retained. However, the **inner-instance** template might reset/overwrite some of the **para** values, e.g., **list** makes use of `\listparindent` to explicitly set the paragraph indentation for compatibility.
Default: `<empty>`

inner-level-counter (*tokenlist*) Name of an existing (!) counter that is incremented and used to determine final name of the **inner-instance** or empty if always the same inner instance should be used.

max-inner-levels (*tokenlist*) Maximum number of nested environments of this kind. Only relevant if there is a **inner-level-counter** specified. Default: 4

inner-instance-type (*tokenlist*) Template type of the inner instance. Currently supported types are `list` and `captionedtext`.
Default: `<empty>`

inner-instance (*tokenlist*) Name of the inner instance (if any). If there is an `inner-level-counter` then the instance name gets `-<counter value>` appended.
Default: `<empty>`

tagging-suppress-paras (*boolean*) *describe* Default: `false`

final-code (*tokenlist*) Final setup code Default: `\ignorespaces`

Semantics & Comments: The `blockenv` type handles the overall setup for the document-level environments.

This `blockenv` template supports the legacy list setting that are found in many document classes in the macros `\@listi`, `\@listii`, up to `\@listvi`. It also uses the counter `\@listdepth` to track nesting of block, again mainly to support legacy setups (internally it gives it a more appropriate name but it remains accessible through the $\text{\LaTeX} 2_{\epsilon}$ name).

The internal block nesting level is stored (for historical reasons) in the `\@listdepth` counter and incremented by each block by one. The starting value at top-level (outside any block) is zero. A block environment with `transparent-level=true` also increments the level before it evaluates and sets its parameters but then decrements it again, just before it starts processing its body.

The template first checks that the block is not too deeply nested.

After the level was increased then corresponding `\@list...` macro to update the legacy defaults is called.

It then sets up the tagging via the `tagging-recipe` setting and executes any code in `early-legacy-code`.

Afterwards it calls the appropriate `block` instance based on `block-instance` and current level, e.g., `std-display-1`.

Then it sets up paragraph parameters if a `para-instance` was specified (otherwise they stay as they are).

If a `inner-instance` was specified this is called next, or more precisely: if no `inner-level-counter` was specified the instance `inner-instance` is called.

Otherwise, the `inner-level-counter` is incremented and the instance with the name `inner-instance-inner-level-counter` is called.

Finally, the `final-code` is executed (by default `\ignorespaces`).

The maximum number of `blockenvs` that can be nested into each other is restricted by the $\text{\LaTeX}$ counter `maxblocklevels` with a default value of 6. If this value is increased then it is necessary to provide additional instances, e.g., `std-display-7`, etc. Decreasing is, of course, always possible, then some of the instances defined are not used and instead the user gets an error that there is too much nesting going on.

If the key `transparent-level` is set to `true` then such an environment alters the nesting level only temporarily (while processing the `blockenv` template) and you can therefore nest those environments as often as you like (a typical example would be `flushleft` anywhere in the nesting hierarchy) as long as the level isn't already at `maxblocklevels`).

2.2.2 The block template ‘std’

Attributes:

- begin-vspace** (*skip*) Vertical space before the block. Default: `\topsep`
- begin-extra-vspace** (*skip*) Extra vertical space before the block if the block forms its own paragraph. Default: `\partopsep`
- begin-unchained-vspace** (*skip*) Vertical space before the block to use if this is a nested block, both blocks have items or captions, and these should not be chained; see description below. Default: `.5\topsep`
- para-vspace** (*skip*) The default for ordinary blocks is to use the `\parskip` from the outer galley. In lists and some other special blocks this is then changed. Default: `\parskip`
- end-vspace** (*skip*) Vertical space after the block. Default: value from **begin-vspace**
- end-extra-vspace** (*skip*) Extra vertical space after the block if the block forms its own paragraph. Default: value from **begin-extra-vspace**
- item-vspace** (*skip*) The space in front of an item if the block is a list; if not, the setting has no effect. Default: `\itemsep`
- begin-penalty** (*integer*) Penalty for breaking before the block. Default: `\@beginparpenalty`
- end-penalty** (*integer*) Penalty for breaking after the block. Default: `\@endparpenalty`
- item-penalty** (*integer*) Penalty for breaking before an item in the list (except the first). Default: `\@itempenalty`
- left-margin** (*length*) Space on the left of the block. Default: `\leftmargin`
- right-margin** (*length*) Space on the right of the block. Default: `\rightmargin`
- para-indent** (*length*) Paragraph indentation for paragraphs within the block. Default: `0pt`

Semantics & Comments: Sets up the main block parameters, e.g. its spacing before and after and the indentation on either side.

It also sets up some parameter defaults for the inner level, e.g., **item-penalty**, **item-vspace** and **para-indent**, which may get overwritten by inner instances that are called.

The vertical spacing before the block covers four different use cases: If there is a caption or an item waiting to be placed, and this item allows for “chaining”, and the new block also wants to place an item then no space is added (spacing was already added by the outer block). Instead, the items are chained and placed that the start of the block, i.e., producing a layout like the two nested **itemize** environments here:

- – A second-level item
- Another ...

More text for the first-level item

- Another first-level item

In that case there is also no vertical space after the block. If the items should not be chained (as specified by the setup of the outer block), then one gets a result like this one (using `itemize` environments inside `description` with different treatment of individual description `\items`):

An normal label • A second-level item

- Another ...

More text for the first-level item

An unchained label

- A second-level item
- Another ...

More text for the first-level item

A normal label Another first-level item

If “unchaining” happens, as in the second item, then vertical spacing with the value of `begin-unchained-vspace` is used and at the end you get `end-vertical-space`.

Otherwise, if there is no item or caption waiting to be placed you get a vertical space of `begin-vspace` before the block and if the block is its own paragraph you additionally get `begin-extra-vspace` added to this.

Note that L^AT_EX 2_ε always chained the list items, so the ability to prohibit this is a new functionality.

2.2.3 The para template ‘std’

Attributes:

para-indent (<i>length</i>)	Default: <code>\parindent</code>
begin-hspace (<i>skip</i>)	Horizontal skip added just in front of the indentation box if non-zero
Default: 0pt	
left-hspace (<i>skip</i>)	Default: 0pt
right-hspace (<i>skip</i>)	Default: 0pt
end-hspace (<i>skip</i>)	Default: <code>\@flushglue</code>
fixed-word-spaces (<i>boolean</i>)	Default: false
final-hyphen-demerits (<i>integer</i>)	Default: 5000
newline-cmd (<i>function(0)</i>)	This defines the meaning of <code>\\</code> Default: <code>\@normalcr</code>
para-attr-class (<i>tokenlist</i>)	Default: justify

Semantics & Comments: The `begin-hspace` (normally `0pt`) is the counterpart of `end-hspace` (which is normally `0pt plus 1fil`). It can be useful in special paragraph shapes. The skip is only inserted into the paragraph if it is non-zero. If it is made non-zero then paragraphs are always at least one line including a construct like `\noindent\par!`

The `para-attr-class` takes one of the attributes `justify`, `center`, `raggedright`, `raggedleft`. They are declared in `latex-lab-namespace`.

TODO: to be further documented

2.2.4 The list template ‘std’

Attributes:

counter (*tokenlist*) Counter name to be used in a numbered list or empty, if the list is unnumbered. Default: `<empty>`

item-label (*tokenlist*) Label “string” for a fixed label or as generated from the current counter value. Default: `<empty>`

start (*integer*) Start value for the counter if the list is numbered, otherwise irrelevant. Default: `1`

resume (*boolean*) Should a numbered list be resumed from the last instance? If true value of **start** is ignored. Default: `false`

item-instance (*instance*) Instance of type **item** to be used to format the label string. Default: `basic`

item-vspace (*skip*) The space in front of an item in the list. If not specified the value specified in the block template instance is used.

item-penalty (*integer*) Penalty for breaking before an item (except the first). If not specified the value specified in the block template instance is used.

item-indent (*length*) Horizontal displacement of the item. Default: `0pt`

label-width (*length*) Width reserved for the formatted item label. Default: `\labelwidth`

label-sep (*length*) Horizontal separation between label and following text. Default: `\labelsep`

legacy-support (*boolean*) Is formatting the label via `\makelabel` supported? Default: `false`

Semantics & Comments: Sets up handling of list material, e.g., numbering (if any), layout of items and list elements, and tagging, if requested.

2.2.5 The item template ‘std’

Attributes:

counter-label (<i>function1</i>)	<i>unused.</i>	Default: <code>\arabic{#1}</code>
counter-ref (<i>function1</i>)	<i>unused.</i>	Default: value from counter-label
label-ref (<i>function1</i>)	Referencing items with optional arguments.	
label-autoref (<i>function1</i>)	<i>unused.</i>	Default: item #1
label-format (<i>function1</i>)	Formatting of the label, questionable the way it is used. Default: #1	
label-strut (<i>boolean</i>)	Add a <code>\strut</code> to the label?	Default: false
label-align (<i>choice</i>)	Supported values <code>left</code> , <code>center</code> , <code>right</code> , and <code>parleft</code> . <i>Only partly implemented.</i>	Default: <code>right</code>
label-placement (<i>choice</i>)	Placement of the label in relation to a directly following label (of a following inner list). Supported values are <code>chained</code> , <code>unchained</code> , and <code>standalone</code> .	Default: <code>chained</code>
label-boxed (<i>boolean</i>)	Should the label be boxed?	Default: <code>true</code>
next-line (<i>boolean</i>)		Default: <code>false</code>
text-font (<i>tokenlist</i>)	<i>unused.</i>	
compatibility (<i>boolean</i>)		Default: <code>true</code>

Semantics & Comments: This template is only rudimentary implemented at the moment. It probably needs other keys and the existing ones need a proper implementation!

fix

2.2.6 The captionedtext template ‘thmlike’

Attributes:

numbered (<i>boolean</i>)	Is this kind of environment numbered?	Default: <code>true</code>
counter (<i>tokenlist</i>)	Counter name to be used if the caption is numbered using automatic numbering, otherwise empty.	Default: <code><empty></code>
number (<i>tokenlist</i>)	By default this key contains <code>\NoValue</code> which indicates that the environment is numbered using the counter <code>counter</code> , or if that is empty that no number is produced. If it holds any other value then that value is used as the “number” for the current environment and the environment counter is ignored and not stepped. Default: <code>\NoValue</code>	
title (<i>tokenlist</i>)	Fixed part of the caption, e.g., a theorem-like environment may want to specify “Lemma” here.	Default: <code>-NoValue-</code>
note (<i>tokenlist</i>)	A note, normally supplied through a mandatory argument from the document. However, it also exists as a key, so that it can alternatively be supplied in the key/val list argument of the environment.	Default: <code>-NoValue-</code>
style (<i>instance</i>)	Instance of type <code>thmstyle</code> that actually implements the theorem-like environment.	Default: <code>plain</code>

Semantics & Comments: The template combines the fixed `title` and a number (if present) with the caption text as specified on the document element, if one is given, e.g., “Theorem 1. (Fermat)”. See also the `proof` template, which handles this differently.

Numbering is controlled through the keys `numbered`, `counter` and `number`. If `numbered` is `false` or if the second mandatory argument is `\BooleanTrue` (i.e., numbering was suppressed from within the document) then no numbering happens regardless of any other settings. Otherwise, if `counter` is non-empty the environment is by default numbered using that counter and the counter is automatically stepped. However, an explicit value (other than `\NoValue`) in the key `number` overwrites this: in that case the value of the `number` key is used and the counter is not stepped.

One could change the logic and allow a `number` key setting to always force this to be used.

The key name `number` could have been called `special-number`, because that is what it really is, but that is a lot to type, so I kept it short.

If the supplied mandatory argument for the note (`#3`) is not `\NoValue` it is used to overwrite the `note` key setting. This means on document-level one can add a note to a theorem-like environment in several ways:

```
\begin{axiom}[optional note]
\begin{axiom}[note={optional note},numbered=false]
```

The second variant would be necessary if other parameters are changed as well on the fly.

The bulk of the work is then outsourced to an instance of type `thmstyle`. As many such theorem-like environments share the same layout and only differ in the first caption string they use, there is this split for convenience.

For that reason the `thmstyle` templates assume that the token lists `\l_@@_title_tl`, `\l_@@_number_tl` and `\l_@@_counter` and the boolean `\l_@@_numbered_bool` have been initialized from the above keys.

2.2.7 The `thmstyle` template ‘std’

Attributes:

separator-a (*tokenlist*) Separation to be applied between elements of the heading, typically a space command of some sort.
Default: `\_`

separator-b (*tokenlist*) Additional separation to be applied between elements of the heading, typically a space command of some sort. Default: `\_`

punct (*tokenlist*) Punctuation following the heading. Default: `.`

caption-placement (*choice*) Supported values `chained`, `unchained`, and `standalone`
Default: `unchained`

caption-unbreakable (*boolean*) Can this caption have (implicit or explicit) line breaks?
Default: `false`

before-hspace (*skip*) Horizontal displacement of the heading. Default: `0pt`

after-hspace (*skip*) Space following the heading, only relevant if text follows on the same line. Default: `5pt`

decide

order (*commalist*) Order of elements in the environment caption/heading. Supported values are **title**, **number**, **punct**, **separator-a**, **separator-b**, and **note**.
Default: **title,separator-a,number,separator-b,note,punct**

title-decls (*tokenlist*) Declarations that are applied only to the caption title.
Default: **<empty>**

number-decls (*tokenlist*) Declarations that are applied only to the caption number.
Default: **<empty>**

punct-decls (*tokenlist*) Declarations that are applied only to the caption punctuation.
Default: **<empty>**

note-decls (*tokenlist*) Declarations that are applied only to the caption note.
Default: **<empty>**

title-format (*function1*) Formatting applied to the **title** value.
Default: **\AddPunct{#1}**

number-format (*function1*) Formatting applied to the **number** value. Default: **#1**

punct-format (*tokenlist*) Formatting applied to the **punct** value.
Default: **\AddPunct{#1}**

note-format (*function1*) Formatting applied to the **note** value. Default: **(#1)**

body-decls (*tokenlist*) Declarations that are applied to body of the environment, e.g., font settings. Default: **<empty>**

Semantics & Comments: The template assumes that the token lists **\l_@@_title_tl**, **\l_@@_number_tl** and **\l_@@_counter_tl** and the boolean **\l_@@_numbered_bool** have been initialized by the calling template.

The template makes use of the caption argument (**#3**) using it as the **note** in the **order** key processing. This is why we have the keys **note-decls** and **note-format** for customization but not a **note** key for specifying a note value.

The caption of the environment can consist of a fixed title, a number, a punctuation, some separators (typically spaces) and an optional note. Their order is defined by the key **order**. If a component is specified but has no value (or more exactly the value **\NoValue**), e.g., no note or the numbering is suppressed on individual environments, then the component and any preceding separators are ignored.

Spaces between elements are often uniform so a single **separator** may be enough, but for flexibility the template supports three distinct separators for use in the **order** key and by default uses two of them.

Alternatively, one can omit using **separator** in the **order** key and instead put all necessary spacing into the individual **...-format** keys. This approach is used, for example, if a theorem style is set up with **\newtheoremstyle** and its ninth argument contains a declaration such as

```
\thmname{#1}\thmnumber{ #2}\thmnote{ (#3)}
```

This is then translated to

```

order          = {title,number,punct,note} ,
title-format   = {#1} ,
number-format  = { #2} ,
note-format    = { (#3)} ,

```

when `\newtheoremstyle` sets up a new instance. The downside of this approach is that `\swapnumbers` would not work with such styles (because it would be necessary to transfer the space inside value for the `number-format` key to the value of `title-format`).

If you look closely at the `\newtheoremstyle`, you can see that in the generated `order` key a `punct` was added its value even though it was not explicitly present in the input. This is the way `\newtheoremstyle` worked and so we mimic that.

2.2.8 The `captionedtext` template ‘proof’

Attributes:

title (*tokenlist*) Heading for the environment unless overwritten on document level.
The default value, i.e., `\proofname` which resolves to “Proof” unless changed.
Default: `\proofname`

punct (*tokenlist*) Punctuation following the heading. Default: `.`

note (*tokenlist*) Optional note for the proof. Default: `\NoValue`

caption-placement (*choice*) Supported values `chained`, `unchained`, and `standalone`
Default: `unchained`

caption-unbreakable (*boolean*) Can this caption have (implicit or explicit) line breaks?
Default: `false`

before-hspace (*skip*) Horizontal displacement of the heading. Default: `0pt`

after-hspace (*skip*) Space following the heading, only relevant if text follows on the same line. Default: `5pt`

caption-decls (*tokenlist*) Declarations that are applied to the whole caption, e.g., some font settings. Default: `\empty`

title-decls (*tokenlist*) Declarations that are applied only to the caption title.
Default: `\empty`

punct-decls (*tokenlist*) Declarations that are applied only to the caption punctuation.
Default: `\empty`

note-decls (*tokenlist*) Declarations that are applied only to the caption note.
Default: `\empty`

title-format (*function1*) Formatting applied to the `title` value. Default: `#1`

punct-format (*function1*) Formatting applied to the `punct` value.
Default: `\AddPunct{#1}`

note-format (*function1*) Formatting applied to the `note` value. Default: `#1`

body-decls (*tokenlist*) Declarations that are applied to body of the environment, e.g., font settings. Default: `\empty`

Semantics & Comments: The “unnumbered?” argument (#2) is ignored, as proofs aren’t numbered. The template makes use of the caption argument (#3) but in contrast to theorem-like environments this template replaces the `title` key value with the content of this argument (if not `\NoValue`).

Typically there is only one layout for proofs so that there is no need to split the formatting over two templates as done for theorem-like environment. That’s the reason why the template has several layout customization parameters.

3 Declaring standard display block environments and their instances

Historically the $\text{\LaTeX}$ kernel has defined a number of block environments directly, e.g., `center` or lists like `itemize`, but left others to be set up by document classes. For now we declare all of them here, but in the future, some (or even all) might get moved to new class files.

`\SimpleBlockEnv` Most of the standard block environments have no need for a caption, so to simplify the setup we have added the command `\SimpleBlockEnv` that hides the arguments 2–4 required by a `blockenv` instance and gives them suitable values, i.e., `\BooleanFalse\NoValue\NoValue`. This way, a document level definition for the `center` environment will look like this:

```
\NewDocumentEnvironment{center} { !0{} }
  { \SimpleBlockEnv{center}{#1} } { \BlockEnvEnd }
```

instead of the more verbose

```
\NewDocumentEnvironment{center} { !0{} }
  { \UseInstance{blockenv}{center}{#1} \BooleanFalse \NoValue \NoValue }
  { \BlockEnvEnd }
```

We use `!0{}` for the optional argument so that it is only recognized if it immediately follows `\begin{center}` without any spaces to avoid that a `[` at the start of the body text is misinterpreted as the opening bracket of the optional argument. This is only done for environments where this could be a problem.

This will then call the `center` instance of type `blockenv` that handles the rest.

`\BlockEnv` For the environments that make use of the other arguments, we offer `\BlockEnv` as syntactic sugar so that most environment declarations look similar. And we use `\BlockEnvEnd` in both cases to finish off.

₁ `(*class-code)`

In the following sections we provide for all block environments the top-level definition and all instances that are used by it. Instances of type `block` are often reused across the environments, in which case we just provide cross-references. Note that this is a design decision, different classes may want to have adjusted settings for individual environments, in which case they would provide special `block` instances instead of reusing, say, the `std-display-level` instances.

3.1 The display and displayflattened environments

`displayblock` (*env.*) There are two basic block environments (`displayblock` and `displayblockflattened`) which are similar to $\text{\LaTeX} 2_{\epsilon}$'s `trivlist` except that they aren't degenerated lists and thus have no hidden `\item` inside.

```

2 \NewDocumentEnvironment{displayblock}{!0}{ }
3   { \SimpleBlockEnv{displayblock} {#1} } { \BlockEnvEnd }

4 \NewDocumentEnvironment{displayblockflattened}{!0}{ }
5   { \SimpleBlockEnv{displayblockflattened} {#1} } { \BlockEnvEnd }

```

3.1.1 Their blockenv instances

`blockenv displayblock` (*inst.*) This is like $\text{\LaTeX} 2_{\epsilon}$'s `trivlist`, i.e., it produces a vertical block with default setting, but doesn't put a list inside but uses a `<Div>` structure. We list all keys, those with default values, commented out.

```

6 \DeclareInstance{blockenv}{displayblock}{std}
7 {
8   name                = displayblock
9   ,tagging-recipe      = standard
10  ,tag-name            =
11  ,tag-attr-class      =
12  ,transparent-level   = true
13  ,early-legacy-code   =
14  ,late-legacy-code    =
15  ,block-instance      = std-display
16  ,para-instance       =
17  ,tagging-suppress-paras = false
18  ,inner-instance      =
19  ,inner-instance-type  =           % not relevant as there is no inner instance
20  ,inner-level-counter =           % not relevant as there is no inner instance
21  ,max-inner-levels    = 4         % not relevant as there is no inner instance
22  ,final-code          = \ignorespaces
23 }

```

The block uses the instance `std-display` which is shown below.

`blockenv displayblockflattened` (*inst.*) This flattens inner paragraphs without any surrounding tag structure by using the basic tagging recipe.

```

24 \DeclareInstance{blockenv}{displayblockflattened}{std}
25 {
26   name                = displayblockflattened
27   ,tagging-recipe      = basic
28   ,tagging-suppress-paras = true
29   ,transparent-level   = true
30 }

```

3.1.2 Their block instances

We provide 6 nesting levels (as in $\text{\LaTeX} 2_{\epsilon}$). If you want to provide more you need to change the `maxblocklevels` counter, offer further `std-display-⟨level⟩` instances but also define further (legacy) `\list⟨romannumeral⟩` commands for the defaults. If not,

then the settings from the previous level are reused automatically—which may or may not be good enough).

```
31 \setcounter{maxblocklevels}{6}
```

`block std-display-1` (*inst.*) We show all keys here for reference, with those using their default values commented out:

```
block std-display-2 (inst.) 32 \DeclareInstance{block}{std-display-1}{std}
block std-display-3 (inst.) 33 {
block std-display-4 (inst.) 34 % ,begin-vspace = \topsep
block std-display-5 (inst.) 35 % ,begin-extra-vspace = \partopsep
block std-display-6 (inst.) 36 % ,para-vspace = \parskip
37 % ,end-vspace = \KeyValue{begin-vspace}
38 % ,end-extra-vspace = \KeyValue{begin-extra-vspace}
39 % ,item-vspace = \itemsep
40 % ,begin-penalty = \UserName{@beginparpenalty}
41 % ,end-penalty = \UserName{@endparpenalty}
42 % ,left-margin = Opt
43 % ,right-margin = \rightmargin
44 % ,para-indent = Opt
45 }

46 \DeclareInstanceCopy{block}{std-display-2}{std-display-1}
47 \DeclareInstanceCopy{block}{std-display-3}{std-display-1}
48 \DeclareInstanceCopy{block}{std-display-4}{std-display-1}
49 \DeclareInstanceCopy{block}{std-display-5}{std-display-1}
50 \DeclareInstanceCopy{block}{std-display-6}{std-display-1}
```

3.2 The center, flushleft, and flushright environments

All three environments use the `std-display` instance as block instance. They only differ in the choice of `para` instance.

`center` (*env.*) For now we redeclare various document environments as late as possible in order to make
`flushleft` (*env.*) tagging work, even if classes have changed the definitions. Of course, this means that
`flushright` (*env.*) such changes get lost.

```
51 \AddToHook{begindocument/before}[./legacy-core]{
52 \RenewDocumentEnvironment{center} { !0{} }
53 { \SimpleBlockEnv{center}{#1} } { \BlockEnvEnd }

54 \RenewDocumentEnvironment{flushright} { !0{} }
55 { \SimpleBlockEnv{flushright}{#1} } { \BlockEnvEnd }

56 \RenewDocumentEnvironment{flushleft} { !0{} }
57 { \SimpleBlockEnv{flushleft}{#1} } { \BlockEnvEnd }
58 }
```

3.2.1 Their blockenv instances

`blockenv center` (*inst.*) The `center` environment is defined through the `blockenv` instance `center` which makes use of the `block` instance `std-display-⟨level⟩` and the `para` instance `center`. The block nesting level is not incremented. With respect to tagging, text separated by `\par` commands (or empty lines) inside the environment is not tagged as separate paragraphs, i.e., the whole environment is considered to be part of an outer paragraph.

```
59 \DeclareInstance{blockenv}{center}{std}{
```

```

60     name                = center
61     ,tag-name            =
62     ,tag-attr-class      =
63     ,tagging-recipe       = basic
64     ,tagging-suppress-paras = true
65     ,inner-level-counter  =
66     ,transparent-level    = true
67     ,early-legacy-code    =
68     ,late-legacy-code     =
69     ,block-instance       = std-display
70     ,para-instance        = center
71     ,inner-instance       =
72 }

```

`blockenv flushleft (inst.)` Same as `center` except that we use the `para` instance `raggedright`.

```

\DeclareInstance{blockenv}{flushleft}{std}{
  name                = flushleft
  ,tag-name            =
  ,tag-attr-class      =
  ,tagging-recipe       = basic
  ,tagging-suppress-paras = true
  ,inner-level-counter  =
  ,transparent-level    = true
  ,early-legacy-code    =
  ,late-legacy-code     =
  ,block-instance       = std-display
  ,para-instance        = raggedright
  ,inner-instance       =
}

```

Or more concise in the source and perhaps even faster in processing if only few keys are changed:

```

73 \DeclareInstanceCopy{blockenv}{flushleft}{center}
74 \EditInstance{blockenv}{flushleft}{
75     name                = flushleft
76     ,para-instance      = raggedright }

```

`blockenv flushright (inst.)` Same game for `flushright`.

```

77 \DeclareInstanceCopy{blockenv}{flushright}{center}
78 \EditInstance{blockenv}{flushright}{
79     name                = flushright
80     ,para-instance      = raggedleft }

```

3.2.2 Their block instances

They all use the block instances `std` which have already been set up in section [3.1.2](#).

3.2.3 Their para instances

Formatting of paragraphs is handled through the `para-instance` key which either refers to a instance of type `para` or is empty, in which case the handling of paragraphs is inherited. The predefined instances are discussed in section [4](#).

3.3 The quote and quotation environments

L^AT_EX 2_ε has two environments for quoting: `quote` and `quotation`. By default they differ only in indentation of inner paragraphs. This is handled by using separate block instances. The paragraph setup is inherited. The block nesting level is incremented.

The tag names are both role-mapped to `<BlockQuote>`.

`quote (env.)` We can't use `\RenewDocumentEnvironment` for `quote` and other environments that `quotation (env.)` are class defined, because some classes aren't implementing them at all. So we use `\DeclareDocumentEnvironment` instead. This problem will vanish if all such definitions move in new versions of the classes instead.

```
81 \AddToHook{begindocument/before}[./legacy-quotes]{
82   \DeclareDocumentEnvironment{quote}{!0}{ }
83   { \SimpleBlockEnv{quote} {#1} } { \BlockEnvEnd }

84   \DeclareDocumentEnvironment{quotation}{!0}{ }
85   { \SimpleBlockEnv{quotation} {#1} } { \BlockEnvEnd }
86 }
```

3.3.1 Their blockenv instances

`blockenv quotation (inst.)` For the quotation environment:

```
87 \DeclareInstance{blockenv}{quotation}{std}{
88   name = quotation
89   ,tag-name = \UseStructureName{block/quotation}
90   ,tag-attr-class =
91   ,tagging-recipe = standard
92   ,inner-level-counter =
93   ,transparent-level = false
94   ,early-legacy-code =
95   ,late-legacy-code =
96   ,block-instance = quotation
97   ,inner-instance =
98 }
```

`blockenv quote (inst.)` For the quote environment:

```
99 \DeclareInstance{blockenv}{quote}{std}{
100   name = quote
101   ,tag-name = \UseStructureName{block/quote}
102   ,tag-attr-class =
103   ,tagging-recipe = standard
104   ,inner-level-counter =
105   ,transparent-level = false
106   ,early-legacy-code =
107   ,late-legacy-code =
108   ,block-instance = quote
109   ,inner-instance =
110 }
```

3.3.2 Their block instances

`block quote-1` (*inst.*) Default layout is to indent equally from both sides. Note that settings here also affect `block quote-2` (*inst.*) verse as it currently reuses the block instances!

```

block quote-3 (inst.) 111 \DeclareInstance{block}{quote-1}{std}{
block quote-4 (inst.) 112     right-margin = \KeyValue{left-margin}
block quote-5 (inst.) 113     ,para-vspace = \parsep
block quote-6 (inst.) 114 }

115 \DeclareInstanceCopy{block}{quote-2}{quote-1}
116 \DeclareInstanceCopy{block}{quote-3}{quote-1}
117 \DeclareInstanceCopy{block}{quote-4}{quote-1}
118 \DeclareInstanceCopy{block}{quote-5}{quote-1}
119 \DeclareInstanceCopy{block}{quote-6}{quote-1}

```

`block quotation-1` (*inst.*) Quotation additionally changes the `para-indent`.

```

block quotation-2 (inst.) 120 \DeclareInstance{block}{quotation-1}{std}
block quotation-3 (inst.) 121 { para-indent = 1.5em , right-margin = \KeyValue{left-margin} }
block quotation-4 (inst.) 122 \DeclareInstanceCopy{block}{quotation-2}{quotation-1}
block quotation-5 (inst.) 123 \DeclareInstanceCopy{block}{quotation-3}{quotation-1}
block quotation-6 (inst.) 124 \DeclareInstanceCopy{block}{quotation-4}{quotation-1}
125 \DeclareInstanceCopy{block}{quotation-5}{quotation-1}
126 \DeclareInstanceCopy{block}{quotation-6}{quotation-1}

```

3.4 The verse environment

The `verse` environment of L^AT_EX is intended for poetry. Not sure what that should mean with respect to tagging.

`verse` (*env.*) Implementation is like `quote` etc.

```

127 \AddToHook{begindocument/before}[./legacy]{
128   \DeclareDocumentEnvironment{verse}{!0{}}
129   { \SimpleBlockEnv{verse} {#1} } { \BlockEnvEnd }
130 }

```

3.4.1 Their blockenv instances

`blockenv verse` (*inst.*)

```

131 \DeclareInstance{blockenv}{verse}{std}{
132   name = verse
133   ,tag-name = \UseStructureName{block/verse}
134   ,tag-attr-class =
135   ,tagging-recipe = standard
136   ,inner-level-counter =
137   ,transparent-level = false
138   ,early-legacy-code =
139   ,late-legacy-code =
140   ,block-instance = quote % reuse?
141   ,para-instance = verse
142   ,inner-instance =
143 }

```

The special indentation on continuation lines (the way L^AT_EX handled poetry) is done in the `para` instance `verse`, defined later on.

3.5 The verbatim, verbatim* and alltt environments

`verbatim (env.)` Here are the definitions for the verbatim environments. They look somewhat different
`verbatim* (env.)` than others (but this isn't the final definition). At the moment we use 2 optional arguments, the second is only there so that there is yet another scan even if one optional argument got detected. That then scans away the newline so that afterwards we can reinsert one via `\obeyedline`. A better solution will be to use a `c` specifier for grabbing the body, but that is for another day not Christmas Eve.

```

144 \AddToHook{begindocument/before}[./legacy-verbatim]{
145   \RenewDocumentEnvironment{verbatim}{={late-legacy-code} !o !o }
146   { \SimpleBlockEnv{verbatim} {#1} \obeyedline } { \BlockEnvEnd }

147 \RenewDocumentEnvironment{verbatim*}{={late-legacy-code} !o !o }
148   { \SimpleBlockEnv{verbatim*} {#1} \obeyedline } { \BlockEnvEnd }

```

`alltt (env.)` The `alltt` package implements a variation on verbatim handling where backslash and
`alltt* (env.)` braces retain their normal meanings. We also reimplement it using the template approach. The `alltt*` variant didn't exist in the package, but it is trivial to set it up as well.

```

149 \NewDocumentEnvironment{alltt}{={late-legacy-code} !o }
150   { \SimpleBlockEnv{alltt} {#1} } { \BlockEnvEnd }
151 \NewDocumentEnvironment{alltt*}{={late-legacy-code} !o }
152   { \SimpleBlockEnv{alltt*} {#1} } { \BlockEnvEnd }
153 }

```

3.5.1 Their blockenv instances

`blockenv verbatim (inst.)` The `verbatim` environment is defined through `blockenv` instance `verbatim` that makes use of the `block` instance `verbatim-⟨level⟩` and the `para` instance `justify`. The block nesting level is not incremented. Verbatim processing requires various `\catcode` changes, etc. and as a consequence a special parsing routine that grabs the whole environment while these catcodes are in force. This setup is done in the `final-code` key and its last action is to initiate the special parsing.

```

154 \DeclareInstance{blockenv}{verbatim}{std}{
155   name = verbatim
156   ,tag-name = \UseStructureName{block/verbatim}
157   ,tag-attr-class =
158   ,tagging-recipe = standard
159   ,tagging-suppress-paras = true
160   ,inner-level-counter =
161   ,transparent-level = true
162   ,early-legacy-code =
163   ,late-legacy-code =
164   ,block-instance = verbatim
165   ,inner-instance =
166   ,para-instance = justify

```

Here is where `verbatim` and `verbatim*` technically differ: in the former we set up spaces to become nonbreakable spaces (if necessary followed by a `\pdfmakespace` in the pdfTeX engine) and in `verbatim*` we set it up to generate visible space chars.

```

167   ,final-code = \legacyverbatimsetup{invisible}

```

Then we start the special scanning process to look for `\end{verbatim}` with special catcodes and grab everything in between. For `verbatim*` we use `\@sxverbatim` to look for `\end{verbatim*}` instead.¹

```
168                                     \@sxverbatim
169 }
```

The role-mapping is `<verbatim>` to `<Code>` and `<codeline>` to `<Sub>` (which is role mapped to `<Span>` in pdf 1.7). Sub inside Code is allowed according the errata of ISO 32005. The paragraphs inside `verbatim` are flattened. Line numbers should be inside the `<codeline>` structure and be tagged either as `<Lbl>` or `<Artifact><Lbl>`.

`blockenv verbatim* (inst.)` The implementation of `verbatim*` is similar using the `blockenv` instance `verbatim*`. Its `final-code` sets up visible spaces and a slightly different parsing that grabs everything up to `\end{verbatim*}`. Otherwise the setup is identical.

```
170 \DeclareInstance{blockenv}{verbatim*}{std}{
171     name = verbatim
172     ,tag-name = \UseStructureName{block/verbatim}
173     ,tag-attr-class =
174     ,tagging-recipe = standard
175     ,tagging-suppress-paras = true
176     ,inner-level-counter =
177     ,transparent-level = true
178     ,early-legacy-code =
179     ,late-legacy-code =
180     ,block-instance = verbatim
181     ,inner-instance =
182     ,para-instance = justify
183     ,final-code = \legacyverbatimsetup{visible}
184                 \@sxverbatim
185 }
```

`blockenv alltt (inst.)` The implementation of the `alltt` environment from the `alltt` is more or less identical as well. We just need a slightly different final code to keep backslash and braces functional.

```
186 \DeclareInstance{blockenv}{alltt}{std}{
187     name = alltt
188     ,tag-name = \UseStructureName{block/verbatim}
189     ,tag-attr-class =
190     ,tagging-recipe = standard
191     ,tagging-suppress-paras = true
192     ,inner-level-counter =
193     ,transparent-level = true
194     ,early-legacy-code =
195     ,late-legacy-code =
196     ,block-instance = verbatim
197     ,inner-instance =
198     ,para-instance = justify
```

private tag instead?

¹Perhaps there should be some other command names for this?

Now set up the special environment settings with most characters verbatim. We don't even have to scan ahead for the `\end{alltt}` because backslash and braces still have their normal meaning.

```
199 ,final-code          = \legacyallttsetup {invisible}
200 }
```

`blockenv alltt* (inst.)` The `alltt*` variant didn't exist in the `alltt` package, but it is trivial to set it up as well.

```
201 \DeclareInstance{blockenv}{alltt*}{std}{
202   name                = alltt*
203   ,tag-name           = \UseStructureName{block/verbatim}
204   ,tag-attr-class     =
205   ,tagging-recipe     = standard
206   ,tagging-suppress-paras = true
207   ,inner-level-counter =
208   ,transparent-level  = true
209   ,early-legacy-code  =
210   ,late-legacy-code   =
211   ,block-instance     = verbatim
212   ,inner-instance     =
213   ,para-instance      = justify
214   ,final-code         = \legacyallttsetup {visible}
215 }
```

private tag instead?

3.5.2 Their block instances

`block verbatim-1 (inst.)` Verbatim instances have their own levels so that one can specify specific indentations or vertical separations between lines.

```
block verbatim-3 (inst.) 216 \DeclareInstance{block}{verbatim-1}{std} {
block verbatim-4 (inst.) 217   ,left-margin      = Opt
block verbatim-5 (inst.) 218   ,para-vspace     = Opt
block verbatim-6 (inst.) 219 }
220 \DeclareInstanceCopy{block}{verbatim-2}{verbatim-1}
221 \DeclareInstanceCopy{block}{verbatim-3}{verbatim-1}
222 \DeclareInstanceCopy{block}{verbatim-4}{verbatim-1}
223 \DeclareInstanceCopy{block}{verbatim-5}{verbatim-1}
224 \DeclareInstanceCopy{block}{verbatim-6}{verbatim-1}
```

3.6 The standard lists: `itemize`, `enumerate`, and `description`

`itemize (env.)` For the standard lists everything is managed by the `blockenv` instances. For the list we
`enumerate (env.)` do not require that the optional argument directly follows without spaces as there can be
`description (env.)` no conflict with any following text (only `\item` or an empty line or the optional argument would be possible).

```
225 \AddToHook{begindocument/before}[./legacy-lists]{
226   \RenewDocumentEnvironment{itemize}{ 0{} }
227   { \SimpleBlockEnv{itemize} {#1} } { \BlockEnvEnd }
228   \RenewDocumentEnvironment{enumerate}{ 0{} }
229   { \SimpleBlockEnv{enumerate} {#1} } { \BlockEnvEnd }
230   \DeclareDocumentEnvironment{description}{ 0{} }
231   { \SimpleBlockEnv{description} {#1} } { \BlockEnvEnd }
232 }
```

3.6.1 Their blockenv instances

`blockenv itemize` (*inst.*) The `itemize` environment is defined through the `blockenv` instance `itemize` which makes use of the block instance `list-⟨level⟩`, and an inner instance `itemize-⟨inner-level⟩` of type `list`. The paragraph setup is inherited.² The `⟨inner-level⟩` is determined through `\@itemdepth`. The block nesting level and the inner list nesting level are incremented.

```

233 \DeclareInstance{blockenv}{itemize}{std}{
234   name                = itemize
235   ,tag-name           = \UseStructureName{block/itemize}
236   ,tag-attr-class     = itemize
237   ,tagging-recipe     = list
238   ,inner-level-counter = \@itemdepth
239   ,transparent-level  = false
240   ,max-inner-levels   = 4
241   ,early-legacy-code  =
242   ,late-legacy-code   =
243   ,block-instance     = std-list
244   ,inner-instance-type = list
245   ,inner-instance     = itemize
246   ,para-instance      =
247 }
```

`blockenv enumerate` (*inst.*) The `enumerate` environment is similar to `itemize` but uses the `blockenv` instance `enumerate`, the block instance `list-⟨level⟩`, and the inner instance `enumerate-⟨inner-level⟩`. The `⟨inner-level⟩` is determined through `\@enumdepth`.

```

248 \DeclareInstance{blockenv}{enumerate}{std}{
249   name                = enumerate
250   ,tag-name           = \UseStructureName{block/enumerate}
251   ,tag-attr-class     = enumerate
252   ,tagging-recipe     = list
253   ,transparent-level  = false
254   ,max-inner-levels   = 4
255   ,early-legacy-code  =
256   ,late-legacy-code   =
257   ,early-legacy-code  =
258   ,block-instance     = std-list
259   ,inner-level-counter = \@enumdepth
260   ,inner-instance-type = list
261   ,inner-instance     = enumerate
262 }
```

`blockenv description` (*inst.*) The `description` environment uses the `blockenv` instance `description`, the block instance `list-⟨level⟩`, and the inner instance `description`.

In $\text{\LaTeX} 2_{\epsilon}$ that was no dependency on the nesting level, i.e., the environment has the same appearance on all nesting levels, but there is actually no good reason for disallowing layout adjustments on each level. All we have to do for this is to provide a value `inner-level-counter` and allocate a counter register for that.

We allow for 6 levels.

²In the $\text{\LaTeX} 2_{\epsilon}$ implementation justified paragraphs were forced, even if the whole document was set in ragged text. If this slightly strange behavior is desired then one has to set the `para-instance` key to `justify`.

```

263 \DeclareInstance{blockenv}{description}{std}{
264   name = description
265   ,tag-name = \UseStructureName{block/description}
266   ,tag-attr-class = description
267   ,tagging-recipe = list
268   ,inner-level-counter = \@descriptiondepth
269   ,transparent-level = false
270   ,max-inner-levels = 6
271   ,early-legacy-code =
272   ,late-legacy-code =
273   ,block-instance = std-list
274   ,inner-instance-type = list
275   ,inner-instance = description
276 }

```

\@descriptiondepth Counting nested description environments.

```

277 \newcount\@descriptiondepth

```

(End of definition for \@descriptiondepth. This function is documented on page ??.)

3.6.2 Their block instances

block std-list-1 (*inst.*) The block instances for the various list environments use the same underlying instance (well, by default) and nothing needs to be set up specifically (because that is already done in the legacy `\list<romannumeral>` unless a different layout is wanted.

```

block std-list-4 (inst.) 278 \DeclareInstance{block}{std-list-1}{std}{
block std-list-5 (inst.) 279 %   begin-vspace = \topsep
block std-list-6 (inst.) 280 %   ,begin-extra-vspace = \partopsep

```

This is the only one we have to explicitly set for lists if the default setup is wanted.

```

281   ,para-vspace = \parsep

```

Everything else uses the template defaults.

```

282 %   ,end-vspace = \KeyValue{begin-vspace}
283 %   ,end-extra-vspace = \KeyValue{begin-extra-vspace}
284 %   ,item-vspace = \itemsep
285 %   ,begin-penalty = \UseName{@beginparpenalty}
286 %   ,end-penalty = \UseName{@endparpenalty}
287 %   ,left-margin = \leftmargin
288 %   ,right-margin = \rightmargin
289 %   ,para-indent = 0pt
290 }

291 \DeclareInstanceCopy{block}{std-list-2}{std-list-1}
292 \DeclareInstanceCopy{block}{std-list-3}{std-list-2}
293 \DeclareInstanceCopy{block}{std-list-4}{std-list-3}
294 \DeclareInstanceCopy{block}{std-list-5}{std-list-4}
295 \DeclareInstanceCopy{block}{std-list-6}{std-list-5}

```

If the legacy `\list<romannumeral>` is not used in a modern class then, of course, these instances all need to set up the different parameters explicitly. The new implementation of the standard classes (will) show that approach.

3.6.3 Their list instances

For all list instances we have to say what kind of label we want (`item-label`) and how it should be formatted.

`list itemize-1 (inst.)` For `itemize` environments this is all we need to do and we refer back to the external definitions rather than defining the `item-label` code in the instance to ensure that old documents still work.

```
list itemize-2 (inst.)
list itemize-3 (inst.)
list itemize-4 (inst.)
296 \DeclareInstance{list}{itemize-1}{std}{ item-label = \labelitemi }
297 \DeclareInstance{list}{itemize-2}{std}{ item-label = \labelitemii }
298 \DeclareInstance{list}{itemize-3}{std}{ item-label = \labelitemiii }
299 \DeclareInstance{list}{itemize-4}{std}{ item-label = \labelitemiv }
```

`list enumerate-1 (inst.)` The `enumerate` environments are similar, except that we also have to say which counter to use on each level.

```
list enumerate-2 (inst.)
list enumerate-3 (inst.)
list enumerate-4 (inst.)
300 \DeclareInstance{list}{enumerate-1}{std}
301 { item-label = \labelenumi , counter = enumi }
302 \DeclareInstance{list}{enumerate-2}{std}
303 { item-label = \labelenumii , counter = enumii }
304 \DeclareInstance{list}{enumerate-3}{std}
305 { item-label = \labelenumiii , counter = enumiii }
306 \DeclareInstance{list}{enumerate-4}{std}
307 { item-label = \labelenumiv , counter = enumiv }
```

`list description (inst.)` In $\text{\LaTeX} 2_{\epsilon}$ the `description` lists used only a single list instance with only one key not using the default. But in this implementation we allow for customization of every level, even though we aren't making use of it by default.

Doing that means that you can only use a limited number of nested environments (while in $\text{\LaTeX} 2_{\epsilon}$ one could have arbitrary nesting, so let's hope 6 levels are enough).

TODO: consider reusing the last level if you run out of specified levels rather than using `max-inner-levels`.

```
308 \DeclareInstance{list}{description-1}{std} { item-instance = description }
309 \DeclareInstanceCopy{list}{description-2}{description-1}
310 \DeclareInstanceCopy{list}{description-3}{description-1}
311 \DeclareInstanceCopy{list}{description-4}{description-1}
312 \DeclareInstanceCopy{list}{description-5}{description-1}
313 \DeclareInstanceCopy{list}{description-6}{description-1}
```

3.6.4 Their item instances

`item basic (inst.)` There are two item instances to set up: `description` for use with the `description` environment and `basic` for use with all other lists (up to now).

```
314 \DeclareInstance{item}{basic}{std}
315 {
316     label-align = right,
317     label-ref=\def\@currentlabel{#1}\def\@currentlabelname{#1}
318 }
319 \DeclareInstance{item}{description}{std}{
320     ,label-format = \normalfont\bfseries #1
321     ,label-align = left
322     ,label-ref=\def\@currentlabel{#1}\def\@currentlabelname{#1}
323 }
```

3.7 The legacy list and trivlist environments

In $\text{\LaTeX} 2_{\epsilon}$, `trivlist` was used to define various display environments that aren't really lists at all. To support such legacy definitions (even though they should be updated to achieve proper tagging) we continue to support and implement it as a `list` environment with a few hardwired settings mimicking the original behavior.

The legacy 2e list environment is more complicated as we have to get the extra arguments accounted for.

```

324 \AddToHook{begindocument/before}[./legacy]{
325   \RenewDocumentEnvironment{list}{0}{m m }
326   {

```

We do this by storing them away and then call the list instance. Inside this instance the `early-legacy-code` key contains `\legacylistsetup` which makes use of the stored values.

```

327     \tl_set:Nn \l_@@_legacy_env_params_tl
328     {
329       \tl_set:Nn \@itemlabel {#2}
330       #3
331     }

```

The $\text{\LaTeX} 2_{\epsilon}$ lists don't support captions so we use `\SimpleBlockEnv`.

```

332   \SimpleBlockEnv{list} {#1}
333   }
334   { \BlockEnvEnd }
335   }

```

`trivlist (env.)` $\text{\LaTeX} 2_{\epsilon}$ defined `trivlist` as an implementation of `list` (or rather the other way around).

```

336 \AddToHook{begindocument/before}[./legacy]{
337   \RenewDocumentEnvironment{trivlist}{!0}{ }
338   { \list[#1]{
339     {
340       \dim_zero:N \leftmargin
341       \dim_zero:N \labelwidth
342       \cs_set_eq:NN \makelabel \use:n
343     }
344   }
345   { \BlockEnvEnd }
346   }

```

3.7.1 Its blockenv instance

`blockenv list (inst.)` The generic `list` environment of $\text{\LaTeX} 2_{\epsilon}$ is modeled with a `blockenv` instance named `list`, a `block` instance named `std-list-⟨level⟩`, and an inner instance named `legacy` (with no dependency on the nesting level). This environment has two arguments and customization of the layout is expected to be directly set in the second argument. For this reason this `legacy` instance is something that shouldn't be changed (all that is attempted to provide a way to support legacy setups).

To set up the default settings (as they were used in $\text{\LaTeX} 2_{\epsilon}$) the `early-legacy-code` key gets `\legacylistsetup` assigned that contains the necessary code to set up these

defaults. Changing the `blockenv` is therefore not recommended for the legacy `list` environment.

```

347 \DeclareInstance{blockenv}{list}{std}{
348   name                = list
349   ,tag-name            = \UseStructureName{block/list}
350   ,tag-attr-class      =
351   ,tagging-recipe      = list
352   ,transparent-level   = false
353   ,early-legacy-code   = \legacylistsetup
354   ,late-legacy-code    =
355   ,block-instance      = std-list
356   ,inner-level-counter =
357   ,inner-instance-type = list
358   ,inner-instance      = legacy
359 }

```

3.7.2 Its `list` instance

`list legacy (inst.)` For the legacy `list` environment there is only one instance which is reused on all levels. This is done this way because the legacy `list` environment sets all its parameters through its arguments. So this instances shouldn't really be touched. It sets the `legacy-support` key to true, which means that the list code uses `\makelabel` for formatting the label.

```

360 \DeclareInstance{list}{legacy}{std}{
361   ,item-instance = basic
362   ,legacy-support = true
363 }

```

3.8 Theorem-like environments declared through `\newtheorem`

In standard $\text{\LaTeX}$ theorem-like environments are not defined directly, but with the help of a `\newtheorem` declaration. That allows specifying the typeset environment title, e.g., “Lemma”, and the counter to use to number the environments, e.g., they could be all numbered individually or one could number them using the same counter as some other theorem-like environment.

This was first augmented by the `theorem` package which implemented the idea of a `\theoremstyle`; this is now considered obsolete. Michael Downes from the AMS improved on these early ideas and wrote the `amsthm` package, which offered more functionality including a `\newtheoremstyle` declaration and for the document level a `\swapnumbers` and an `proof` environment. It also provided star-forms for `\newtheorem` (to define an unnumbered environment) and allowed to use star-forms of the theorem-like environments to suppress numbering on an individual instance in the document.

This new implementation based on templates, is supposed to cover the functionality of `amsthm` including its declarations so that documents that use `amsthm` explicitly or implicitly via their class should continue to work seamlessly.

For other packages that provide theorem-like environments we have to see if they could be easily remodeled using the new implementation or if there is a need for extended templates.

Assuming declarations such as

```

% \swapnumbers           % <- commented out
\theoremstyle{definition}
\newtheorem{axiom}[def]{Axiom}

```

in a document, then the following instances of type `blockenv` and `captionedtext` are declared by `\newtheorem`.

3.8.1 The `blockenv` instances they use

Given the above input `\newtheorem` defines the following `blockenv` instance:

```
\DeclareInstance{blockenv}{axiom}{std}{
  name           = theorem-like
  ,tag-name       = \UseStructureName{block/theorem-like}
  ,tagging-recipe = standalone
  ,standalone     = true
  ,transparent-level = true
  ,block-instance:e = thm-
                  \IfInstanceExistsTF{block}
                  { thm-definition-1 }
                  { definition } { plain }
  ,inner-instance-type = captionedtext
  ,inner-instance     = axiom
  ,para-instance      = justify
}
```

The setting for `block-instance` means that it checks if a `block` instance with the name `thm-definition-1` exists. If so then the value `thm-definition` is used, otherwise `thm-plain` is used which is always defined, i.e., if the `theoremstyle` does not specify any special vertical spacing the `block` instance from the `plain` style is reused.

What varies from `blockenv` instance to instance are the values for `block-instance` and `inner-instance`.

We use `<theorem-like>` as the structure name and role-map it to a `<Sect>` because that can hold a `<Caption>`.

3.8.2 The `captionedtext` instances they use

The instance of type `captionedtext` is also defined by `\newtheorem` and in this case it looks like this:

```
\DeclareInstance{captionedtext}{axiom}{thmlike}{
  numbered = true
  ,counter = def
  ,title   = Axiom           % <-- that the title provided to \newtheorem
  ,number  = \NoValue        % <-- for special one-off settings
  ,note    = \NoValue        % <-- value normally document supplied
  ,style   = definition      % <-- that's the used \theoremstyle
}
```

The `number` key should really be called `special-number` as all it does when set to a real value is to overwrite the automatic numbering and force its value as the current number, i.e., enables a one-off overwrite of the number from within the document.

If we uncomment the `\swapnumbers` line in the example above then we get

```
,style    = definition-swap
```

in the `captionedtext` instance instead.

3.8.3 The `thmstyle` instances they use

New theorem styles can be declared with `\newtheoremstyle` which then generates an instance of type `thmstyle`. Alternatively, it is, of course, possible to declare the instances directly (which gives you a bit more flexibility). A few such styles are predeclared, matching what is offered by `amsthm`. These are shown below.

`thmstyle plain` (*inst.*) The main style used for many theorem-like environments, i.e., the one you get if no special `\theoremstyle` has been specified.

```

364 \DeclareInstance{thmstyle}{plain}{std}{
365   ,caption-placement = unchained
366   ,separator-a       = \
367   ,separator-b       = \
368   ,punct             = .
369   ,before-hspace     = 0pt
370   ,after-hspace      = 5pt plus 1pt minus 1pt
371   ,order             = {title,separator-a,number,separator-b,note,punct}
372   ,caption-decls     = \bfseries
373   ,title-decls       =
374   ,number-decls      = \upshape
375   ,punct-decls       =
376   ,note-decls        = \upshape\mdseries
377   ,title-format      = #1
378   ,number-format     = #1
379   ,punct-format      = \AddPunct{#1}
380   ,note-format       = (#1)
381   ,body-decls        = \itshape
382 }
```

`thmstyle remark` (*inst.*) The remark is like plain with two changes:

```

383 \DeclareInstanceCopy{thmstyle}{remark}{plain}
384 \EditInstance{thmstyle}{remark}{
385   ,caption-decls = \itshape
386   ,body-decls   = \normalfont
387 }
```

`thmstyle definition` (*inst.*) The definition is like plain with only a difference in the font used for the body:

```

388 \DeclareInstanceCopy{thmstyle}{definition}{plain}
389 \EditInstance{thmstyle}{definition}{
390   ,body-decls = \normalfont
391 }
```

`thmstyle legacy2e` (*inst.*) Vanilla L^AT_EX 2_ε (without `amsthm` loaded) had a slightly different default. We provide this under the name `legacy2e`. It doesn't use a punctuation after the number and it has slightly different vertical spacing (defined by `thm-legacy2e-1` below).

Thus, to reprocess an old document for tagging that uses `\newtheorem` without loading `amsthm` one has to set `\theoremstyle{legacy2e}` to avoid layout changes. How such a compatibility setting is automated is not yet decided.

```

392 \DeclareInstanceCopy{thmstyle}{legacy2e}{plain}
393 \EditInstance{thmstyle}{legacy2e}{ punct = }
```

3.8.4 The block instances they use

`block thm-plain-1` (*inst.*) Theorems do not support nesting, so in theory we have to set up only one. There are, however, documents that put theorem-like environments inside of lists or other block environments. While that is in most cases somewhat dubious, it can make sense, for example, in `description` lists. So we support it by providing `thm-plain` instances for levels 1 and 2. If somebody really nests them further down, then more such instances need to be declared.

The L^AT_EX default reused the general value of `\parindent` and `\parskip` and, of course, they start at the outer margin.

```

394 \DeclareInstance{block}{thm-plain-1}{std}{
395   ,begin-extra-vspace = 0pt
396   ,left-margin        = 0pt
397   ,para-indent        = \parindent
398   ,para-vspace        = \parskip
399 }

400 \DeclareInstanceCopy{block}{thm-plain-2}{thm-plain-1}

```

`block thm-remark-1` (*inst.*) The `\thmstyle` for “remarks” is defined by `amsthm` to use less vertical spacing. It therefore needs its own block instance.

```

401 \DeclareInstance{block}{thm-remark-1}{std}{
402   ,begin-vspace        = 0.5\topsep
403   ,begin-extra-vspace = 0pt
404   ,left-margin        = 0pt
405   ,para-indent        = \parindent
406   ,para-vspace        = \parskip
407 }

408 \DeclareInstanceCopy{block}{thm-remark-2}{thm-remark-1}

```

`block thm-definition-1` (*inst.*) The `\thmstyle` for “definitions” uses the same settings as the `plain` instances, so those could be reused. However, to make it easy to customize the styles individually we provided named instances.

```

409 \DeclareInstanceCopy{block}{thm-definition-1}{thm-plain-1}
410 \DeclareInstanceCopy{block}{thm-definition-2}{thm-definition-1}

```

`block thm-legacy2e-1` (*inst.*) These are like the plain ones but without resetting `begin-extra-vspace` to zero.

```

block thm-legacy2e-2 (inst.)
411 \DeclareInstance{block}{thm-legacy2e-1}{std}{
412   ,left-margin        = 0pt
413   ,para-indent        = \parindent
414   ,para-vspace        = \parskip
415 }

416 \DeclareInstanceCopy{block}{thm-legacy2e-2}{thm-legacy2e-1}

```

3.9 The proof environment (from `amsthm`)

`proof` (*env.*) The `proof` environment expects one optional argument holding an alternative title for the proof. We parse this optional argument as an implicit key/value argument, so that it is possible to interpret it either as the value for the key `note` or as a key/value list that holds special key settings for this particular environment instance. The result is

analyzed by `\ParseLaTeXeTheoremlike` which then calls a `blockenv` instance with the name `proof`.

In addition we have to set up handling of QED symbols using `\pushQED` and `\popQED` using the logic already defined in `amsthm`. Details on all this is given in the code section of this module but normally this top-level declaration doesn't require any changes. Conceptually, it would be better to disallow spaces before the optional argument here. But `amsthm` never did this, so for compatibility we aren't doing this either.

```

417 \NewDocumentEnvironment{proof}{={optarg}o }
418 { \pushQED{\qed}
419   \ParseLaTeXeTheoremlike {proof} \BooleanTrue {#1} }
420 { \popQED \BlockEnvEnd }

```

blockenv proof (*inst.*) A proof uses its own `proof` instance of type `block` for vertical spacing. As the proof has a heading we use a `captionedtext` instance with name `proof` as the inner instance and the paragraphs of the proof are justified.

```

421 \DeclareInstance{blockenv}{proof}{std}{
422   name = proof
423   ,tag-name = \UseStructureName{block/proof}
424   ,tag-attr-class =
425   ,tagging-recipe = standalone
426   ,standalone = true
427   ,inner-level-counter =
428   ,transparent-level = true
429   ,early-legacy-code =
430   ,late-legacy-code =
431   ,block-instance = proof
432   ,inner-instance-type = captionedtext
433   ,inner-instance = proof
434   ,para-instance = justify
435 }

```

captionedtext proof (*inst.*) We use a special `captionedtext` template to set up the proof because proofs are not numbered and the argument to a proof environment has a somewhat different semantic meaning than that of theorem-like environments.

If the title ends in a punctuation we should not add an additional one, thus we add it with `\AddPunct`.

```

436 \DeclareInstance{captionedtext}{proof}{proof}{
437   ,title = \proofname % default value
438   ,punct = .
439   ,before-hspace = 0pt
440   ,after-hspace = 5pt plus 1pt minus 1pt
441   ,caption-decls = \itshape
442   ,title-format = #1
443   ,punct-format = \AddPunct{#1}
444   ,body-decls = \normalfont
445 }

```

3.9.1 Block instances for the proofs

block proof-1 (*inst.*) Blocks for proofs are pretty normal (the values are taken from the `amsthm` implementation):

```

446 \DeclareInstance{block}{proof-1}{std}{

```

```

447 ,begin-vspace      = 6pt plus 6pt
448 ,left-margin       = 0pt
449 ,para-indent       = \parindent
450 ,para-vspace       = \parskip
451 }
452 \DeclareInstanceCopy{block}{proof-2}{proof-1}

```

4 Declaring para instances

Display block environments often require special paragraph settings and therefore have a `para-instance` key to specify and appropriate instance. Here are the standard instances that are predefined for this purpose.

`para justify (inst.)` Justifying is exactly what the default values do, so the instance hasn't any special setup.

```

453 \DeclareInstance{para}{justify}{std}{
454 % ,para-attr-class      = justify
455 % ,para-indent         = \parindent
456 % ,begin-hspace        = 0pt
457 % ,left-hspace         = \z@skip
458 % ,right-hspace        = \z@skip
459 % ,end-hspace          = \@flushglue
460 % ,final-hyphen-demerits = 5000
461 % ,newline-cmd         = \@normalcr
462 }

```

`para center (inst.)` Centering a paragraph means putting stretchable glue on both sides.

```

463 \DeclareInstance{para}{center}{std}{
464 ,para-attr-class      = center
465 ,para-indent         = 0pt
466 % ,begin-hspace        = 0pt
467 % ,left-hspace         = \@flushglue
468 % ,right-hspace        = \@flushglue
469 % ,end-hspace          = \z@skip
470 % ,final-hyphen-demerits = 0
471 % ,newline-cmd         = \@centercr
472 }

```

`para raggedright (inst.)` This is the plain T_EX version of ragged right, which basically means no hyphenation unless a word is truly longer than a line. This implements `flushleft`.

```

473 \DeclareInstance{para}{raggedright}{std}{
474 ,para-attr-class      = raggedright
475 ,para-indent         = 0pt
476 % ,begin-hspace        = 0pt
477 % ,left-hspace         = \z@skip
478 % ,right-hspace        = \@flushglue
479 % ,end-hspace          = \parfillskip
480 % ,final-hyphen-demerits = 0
481 % ,newline-cmd         = \@centercr
482 }

```

`para raggedleft (inst.)` This here is for `flushright`.

```

483 \DeclareInstance{para}{raggedleft}{std}{

```

```

484 ,para-attr-class      = raggedleft
485 ,para-indent          = Opt
486 % ,begin-hspace       = Opt
487 ,left-hspace          = \@flushglue
488 ,right-hspace         = \z@skip
489 ,end-hspace           = \z@skip
490 ,final-hyphen-demerits = 0
491 ,newline-cmd          = \@centercr
492 }

```

`\centering` These instances are also used to implement declarations for direct use in documents or in user definitions.

```

\raggedleft
\raggedright
\justifying
493 \DeclareRobustCommand\centering {\UseInstance{para}{center}{}}
494 \DeclareRobustCommand\raggedleft {\UseInstance{para}{raggedleft}{}}
495 \DeclareRobustCommand\raggedright{\UseInstance{para}{raggedright}{}}
496 \DeclareRobustCommand\justifying {\UseInstance{para}{justify}{}}

```

L^AT_EX's default is to typeset paragraphs justified.

```
497 \justifying
```

(End of definition for `\centering` and others.)

`para verse (inst.)` For the `verse` environment we use a special `para` instance. If the right hand side should be ragged then a different `right-hspace` is needed.

```

498 \DeclareInstance{para}{verse}{std}{
499   para-attr-class      = justify ,
500   para-indent          = Opt ,
501   begin-hspace         = -1.5em ,
502   left-hspace          = 1.5em ,
503   right-hspace         = Opt ,
504   end-hspace           = \@flushglue ,
505   final-hyphen-demerits = 0 ,
506   newline-cmd          = \@centercr ,
507 }

```

```
508 </class-code>
```

5 Advice on adjusting the layout of standard block environments

to document

6 Tagging support

6.1 Paragraph tags

Paragraphs in L^AT_EX can be nested, e.g., you can have a paragraph containing a display quote, which in turn consists of more than one (sub)paragraph, followed by some more text which all belongs to the same outer paragraph.

In the PDF model and in the HTML model that is not supported — a limitation that conflicts with real life, given that such constructs are quite normal in spoken and written language.

The approach we take to resolve this is to model such “big” paragraphs with a structure named `<semantic-para>` and use `<text-block>` (role-mapped to `<P>`) only for (portions of) the actual paragraph text in a way that the `<text-block>`s are not nested. As a result we have for a simple paragraph the structures

```
<text-block>
  <text-block>
    The paragraph text ...
  </text-block>
</text-block>
```

The `<semantic-para>` structure is role-mapped to `<Part>` or possibly to `<Div>` so we get a valid PDF, but processors who care can identify the complete paragraphs by looking for `<semantic-para>` tags.

In the case of an element, such as a display quote or a display list inside the paragraph, we then have

```
<semantic-para>
  <text-block>
    The paragraph text before the display element ...
  </text-block>
  <display element structure>
    Content of the display structure possibly involving inner <semantic-para> tags
  </display element structure>
  <text-block>
    ... continuing the outer paragraph text
  </text-block>
</semantic-para>
```

In other words such a display block is always embedded in a `<semantic-para>` structure, possibly preceded by a `<text-block>...</text-block>` block and possibly followed by one, though both such blocks are optional.

Thus an `itemize` environment that has some introductory text but no text immediately following the list would be tagged as follows:

```
<semantic-para>
  <text-block>
    The intro text for the itemize environment ...
  </text-block>
  <itemize>
    <LI>
      <itemlabel> label </itemlabel>
      <itembody>
        The text of the first item involving <semantic-para> as necessary ...
      </itembody>
    </LI>
    <LI>
      The second item ...
    </LI>
```

```

        ... further items ...
    </itemize>
</semantic-para>

```

The `<itemize>` is role-mapped to `<L>`.

For some display blocks, such as centered text, we use a simpler strategy. Such blocks still ensure that they are inside a `<semantic-para>` structure but their body uses simple `<text-block>` blocks and not `<semantic-para><text-block>` inside, e.g., the input

```

This is a paragraph with some
\begin{center}
    centered lines

    with a paragraph break between them
\end{center}
followed by some more text.

```

will be tagged as follows:

```

<semantic-para>
  <text-block>
    This is a paragraph with some
  </text-block>
  <text /0 /Layout /TextAlign/Center>
    centered lines
  </text-block>
  <text /0 /Layout /TextAlign/Center>
    with a paragraph break between them
  </text-block>
  <text-block>
    followed by some more text.
</semantic-para>

```

The `semantic-para` structures are added by using the tagging sockets `para/semantic/begin` and `para/semantic/end` declared in `ltagging.dtx`. They can be disabled by assigning these sockets the plug `noop`.

6.1.1 Tagging recipes

There are a number of different tagging recipes that implement different tagging approaches. They are selected through the `tagging-recipe` of the `blockenv` template. Currently the following values are implemented:

noop This recipe does not add tagging structures and also does not set the `endpe` switch. The recipe is meant for environments like `adjustwidth` that only want to change the layout, and which can contain, e.g., sectioning commands.

standalone This recipe does the following:

- Ensure that the `blockenv` is not inside a `<semantic-para>` structure. If necessary, close the open one (and any open `<text-block>` structure).
- Text inside the body of the environment start with `<semantic-para><text-block>` unless the key `tagging-suppress-paras` is set to `true` (which is most likely the wrong thing to do because we then get just `<text-block>` as the structure).
- At the end of the environment close `</text-block>` and possibly an inner `</semantic-para>` if open.
- Finally, ensure that after the environment a new `<semantic-para>` is started, if appropriate, e.g., if text is following.

basic This recipe does the following:

- Ensure that the `blockenv` is inside a `<semantic-para>` structure, if necessary, start one.
- If inside a `<semantic-para><text-block>`, then close the `</text-block>` but leave the `<semantic-para>` open.
- Text inside the body of the environment start with `<semantic-para><text-block>` if `tagging-suppress-paras` is set to `false`, otherwise just with `<text-block>`.
- At the end of the environment close `</text-block>` and possibly an inner `</semantic-para>` if open.
- Then look if the environment is followed by an empty line (`\par`). If so, close the outer `</semantic-para>` and start any following text with `<semantic-para><text-block>`. Otherwise, don't and following text restarts with a just a `<text-block>` (and no paragraph indentation)

standard This recipe is like the **basic** one as far as handling `<semantic-para>` and `<text-block>` is concerned. In addition

- it starts an inner tagging structure (i.e., which is therefore a child of the outer `<semantic-para>`).
- By default this structure is a `<Div>` unless overwritten by the key `tag-name`. If that key is used, a suitable role-map needs to be provided for the name given.
- At the end of the environment that inner structure is closed again so that we are back on the `<semantic-para>` level from the outside.
- Then the lookahead for an empty line is done as described previously.

list This recipe is like the **standard** one except that

- the inner structure is a list (`<L>`).
- Furthermore everything is set up so that we have list items (`<LI>`) with suitable substructures (`<itemlabel>` for the item labels and `<itembody>` for the item bodies).
- If the key `tag-name` is specified, this is used as the tag name for the whole list instead of `<L>`. Of course, it should then have a suitable role-map.

- If the key `tag-attr-class` is specified then this is used as the class attribute. Again, this requires a suitable setup on the outside.
- At the end of the environment the `</itembody>`, `</LI>`, and `</L>` (or the tag name used) are closed.
- Then the lookahead for an empty line is done as described previously.

7 Tracing and debugging

```
\DebugBlocksOn
\DebugBlocksOff
\block_debug_on:
\block_debug_off:
```

These commands enable/disable debugging messages for blocks. They also enable/disable debugging of templates (e.g., call `\DebugTemplatesOn` or `\DebugTemplatesOff`).

The data that is produced is rather verbose and largely guided (so far) by what seemed helpful while developing the code. This needs some cleanup at a later stage. At the moment, if you have the following simple document

cleanup

```
1      \DocumentMetadata{tagging=on, lang=en}
2
3      \documentclass{article}
4
5      \DebugBlocksOn
6
7      \begin{document}
8          \begin{itemize}[item- $\text{vspace}$ =3pt]
9              \item A normal item
10             \item[\textbf{+}] A special item
11          \end{itemize}
12      \end{document}
```

then you will get the following information on the screen and in the `.log` file:

```
[Template] ==> Using instance 'itemize' of type 'blockenv' on line 8
[Template] ==>   template: 'std'; arguments: |item- $\text{vspace}$ =3pt|\BooleanFalse |\NoValue |\NoValue |
[Template] ==> Using instance 'std-list-1' of type 'block' on line 8
[Template] ==>   template: 'std'; argument: |item- $\text{vspace}$ ={3pt}|
[Blocks] ==> @endpe=false on input line 8
[Template] ==> Using instance 'itemize-1' of type 'list' on line 8
[Template] ==>   template: 'std'; arguments: ||\BooleanFalse |\NoValue |\NoValue |
[Blocks] ==> Set first block everypar on input line 8
[Blocks] ==> template:list:std end

[Template] ==> Using instance 'basic' of type 'item' on line 9
[Template] ==>   template: 'std'; argument: ||
[Blocks] ==> Set item block everypar on input line 9
[Blocks] ==> ... in item block everypar on input line 9
[Blocks] ==> Set noop block everypar on input line 9

[Template] ==> Using instance 'basic' of type 'item' on line 10
[Template] ==>   template: 'std'; argument: |label={\textbf {+}}|
[Blocks] ==> item with optional
[Blocks] ==> Set item block everypar on input line 10
[Blocks] ==> ... in item block everypar on input line 10
[Blocks] ==> Set noop block everypar on input line 10

[Blocks] ==> blockenv common ending on input line 11
```

[Blocks] ==> flattened=false on input line 12
 [Blocks] ==> Structure-end semantic-para after displayblock on input line 12

8 New and redefined kernel command

<code>\SimpleBlockEnv</code>	<i>to be documented</i>
<code>\BlockEnv</code>	
<code>\BlockEnvEnd</code>	
<code>\g_block_nesting_depth_int</code>	

<code>\legacyverbatimsetup</code>	<i>to be documented</i>
<code>\legacyallttsetup</code>	
<code>\legacylistsetup</code>	

<code>\@setupverbinvisiblespace</code>	A counterpart definition to the kernel command <code>\@setupverbinvisiblespace</code> , needed as we need to handle real space chars in verbatim.
--	---

<code>\newtheorem</code>	Reimplemented to fit the template approach. <code>\newtheoremstyle</code> was defined by amsthm.
<code>\newtheoremstyle</code>	

<code>\@nthm</code>	These are no longer used (to be removed).
<code>\@xnthm</code>	
<code>\@ynthm</code>	
<code>\@thm</code>	
<code>\@xthm</code>	
<code>\@ythm</code>	
<code>\@othm</code>	
<code>\@begintheorem</code>	
<code>\@opargbegintheorem</code>	
<code>\@endtheorem</code>	

<code>\item</code>	The <code>\item</code> is redefined.
<code>\@itemlabel</code>	

<code>\c@maxblocklevels</code>	A counter to increase or decrease the number of supported level. If increased, one needs to supply additional level instances.
--------------------------------	--

<code>\begin</code>	The <code>\begin</code> is slightly redefined to handle <code>\@doendpe</code> better. TODO: move to kernel
---------------------	---

`\@doendpe` The original $\text{\LaTeX} 2_{\epsilon}$ command is augmented to allow for tagging.

`\para_end:` TODO: consider name, document

`para/begin` The `para/begin` hook is enhanced to support list ends

9 The Implementation

```
509 \<package-start>

510 \<@@=block>

511 \ProvidesPackage {latex-lab-testphase-block}
512 [\ltlabblockdate\space v\ltlabblockversion\space
513 blockenv implementation]

514 \ExplSyntaxOn
```

9.0.1 Handling `\par` after the end of the list

An empty line (or a `\par`) after a list has semantic meaning as it defines whether then following text is logically within the same paragraph as the list (no empty line) or whether it starts a new paragraph and the paragraph containing the list ends at the end of the list (empty line after the list). This is handled by $\text{\LaTeX}$ using a legacy flag called `@endpe` and set of commands inside the generic `\end` (calling `\@doendpe`) and as part of the list environments identifying themselves as “paragraph ending environments” (by setting this flag).

For the reimplementaion of the list environments including support of tagging we need to augment that mechanism slightly and add some kernel hook(s) to add the tagging code if needed.

`\@doendpe` The original $\text{\LaTeX} 2_{\epsilon}$ command is augmented to allow for tagging. TODO: move to the kernel eventually.

```
515 \def\@doendpe{\@endpetrue
516 \def\par
517 {
```

If we are processing a `$$` math display and we encounter a real `\par` after it, we need to add a `\parskip` when tagging is done, because the one added by $\text{\TeX}$ is always canceled by the processing in `\_math\_tag\_dollar\_display\_end:` in that case. This is signaled by the global legacy switch `@domathendpe` which is set to true in that case. Once the skip is applied we set it to false. If there is no `\par` at all, it will be reset in `\everypar` when the next paragraph starts.

But we first have to restore `\par`, otherwise `\skip\_vertical:n` might trigger `\par` in horizontal mode and then loop because it never returns to vertical mode.

```
518 \@restorepar
519 \clubpenalty\@clubpenalty
```

```

520 \if@domathendpe
521 \skip_vertical:n { \tex_parskip:D }
522 \@domathendpefalse
523 \fi

```

At this point we add the tagging code that closes an open `<semantic-para>`, `<text-block>` tag combination, if necessary:

```

524 \tag_socket_use:n {@doendpe}

```

The standard `\par` command (`\par_end:`) acts on `@endpe` and attempts to close a still open `<semantic-para>`s and this would be wrong if it was already closed above. So we have to reset the switch to false first.

```

525 \@endpefalse
526 \everypar{}
527 \par
528 }
529 \everypar{{\setbox\z@\lastbox}
530 \everypar{}
531 \@endpefalse

```

Not sure what is faster: testing for the status of the switch or setting it unconditionally to false (globally), probably roughly the same, so we set it always:

```

532 % \if@domathendpe
533 % \@domathendpefalse
534 % \fi
535 }
536 }

```

(End of definition for `\doendpe`. This function is documented on page 41.)

```

\@endpefalse Some extra debugging lines, but commented out for now.
\@endpetrue
\__block_debug_endpe_typeout:n
537 \def\@endpefalse{
538 \__block_debug_endpe_typeout:n { @endpe~ :=~
539 \if@endpe true \else false \fi -> false \on@line }
540 \global\let\if@endpe\iffalse
541 }
542 \def\@endpetrue {%
543 \__block_debug_endpe_typeout:n { @endpe~ :=~
544 \if@endpe true \else false \fi -> true \on@line }
545 \global\let\if@endpe\iftrue
546 \ifnum\currentgrouptype =14 % semi-simple group
547 \aftergroup\propagate@doendpe
548 \else
549 \ifnum\currentgrouptype =\z@ % no group: top-level
550 \else
551 \ifnum\currentgrouptype =\@ne % simple group
552 \aftergroup\propagate@doendpe
553 \fi
554 \fi
555 \fi
556 }

```

For checking the `@endpe` logic, we have something we can turn into a typeout in tests:

```

557 \cs_new_eq:NN \__block_debug_endpe_typeout:n \use_none:n

```

(End of definition for `\@endpfalse`, `\@endptrue`, and `\__block_debug_endpe_typeout:n`. These functions are documented on page ??.)

`tagssupport/@doendpe` (*socket*) The socket is used in the `\@doendpe` TODO: if this goes into the kernel, the name should probably be different.

```

558 \socket_if_exist:nF{ tagssupport/@doendpe }
559 {
560   \NewTaggingSocket {@doendpe}{0}
561 }

```

`default` (*plug*) If a display block ends and is followed by a blank line we have to end the enclosing paragraph tagging structure.

```

562 \NewTaggingSocketPlug {@doendpe}{default}
563 {
564   \bool_if:NT \l__tag_para_bool
565   {

```

Given that restoring `\par` through the legacy L^AT_EX 2_ε method can take a few iterations (for example, in case of nested lists, e.g., `... \end{itemize} \item ... \par` it can happen that the socket code is called while `@endpe` is already handled and then we should not attempt to close a `<semantic-para>` structure). So we need to check for this.

```

566     \legacy_if:nTF { @endpe }
567     {
568       \__block_debug_endpe_typeout:n {===>~ handle~ @endpe}

```

If the display block currently ending was “flattened” (i.e., uses simplified paragraphs that are not tagged by a combination of `<semantic-para>` followed by `<text-block>`, but simply with a `<text-block>`), then we don’t have to do anything, because the `<text-block>` is already closed.

```

569       \__block_debug_typeout:n
570       { flattened= \bool_if:NTF
571         \l__tag_para_flattened_bool
572         {true}{false}
573         \on@line }
574       \bool_if:NF \l__tag_para_flattened_bool
575       {
576         \UseTaggingSocket{para/semantic/end}
577         {
578           \__block_debug_typeout:n{Structure-end~
579             \UseStructureName{para/semantic}\space
580             after~ displayblock \on@line      }
581         }
582       }
583     }
584     {
585       \__block_debug_endpe_typeout:n{===>~ @endpe~ already~ handled}
586     }
587   }
588 }

589 \AssignTaggingSocketPlug{@doendpe}{default}

```

```

\if@domathendpe Signal that special paragraph handling after a math display is required.
\@domathendpefalse
\@domathendpetrue
590 \newif\if@domathendpe
591 \def\@domathendpefalse{\global\let\if@domathendpe\iffalse}
592 \def\@domathendpetrue {\global\let\if@domathendpe\iftrue}

(End of definition for \if@domathendpe, \@domathendpefalse, and \@domathendpetrue.)

```

There is a general bug in the para handling: when the output routine is triggered the current setting of @endpe affects what happens in the OR. But it shouldn't, so we need to reset its value (which is global) and set it back after the OR has finished. This is what the following code does (final implementation should probably not involve a normal

hook):

```

593 \AddToHook{build/column/before}{%
594 \if@endpe \@endpefalse \aftergroup\@endpetrue \fi
595 }

```

9.0.2 Other useful expl3 commands

This section collects expl3 commands that will be useful in the code here and possibly generally.

`\_block_skip_set_to_last:N` Set a skip register to the value of an immediately preceding skip or zero if there was none.

```

596 \cs_new_protected:Npn \_block_skip_set_to_last:N #1 {
597 \skip_set:Nn #1 { \tex_lastskip:D }
598 }

```

Remove a skip previous skip if it is directly in front (not allowed in unrestricted vertical mode).

```

599 \cs_new_eq:NN \_block_skip_remove_last: \tex_unskip:D

```

(End of definition for _block_skip_set_to_last:N and _block_skip_remove_last:.)

Not sure this is still necessary (or even correct) after the move to \NoValue.

```

600 \cs_generate_variant:Nn \tl_if_novalue:nTF { o }

```

(End of definition for \tl_if_novalue:oTF. This function is documented on page ??.)

9.1 Tracing and debugging interfaces

This follows the same convention as in other modules, but eventually that should be given a better implementation.

Boolean to indicate if we want to get debugging info from commands and templates handling block displays.

```

601 \bool_new:N \g_block_debug_bool

```

(End of definition for \g_block_debug_bool.)

Put debugging info in the code, displayed or not displayed depending on the value in \g_block_debug_bool.

```

602 \cs_new_eq:NN \_block_debug:n \use_none:n
603 \cs_new_eq:NN \_block_debug_typeof:n \use_none:n

```

(End of definition for `\__block_debug:n` and `\__block_debug_typeout:n`.)

```

\block_debug_on: Changing the debugging status.
\block_debug_off:
\__block_debug_gset:
604 \cs_new_protected:Npn \block_debug_on:
605 {
606   \bool_gset_true:N \g__block_debug_bool
607   \__block_debug_gset:
608 }

609 \cs_new_protected:Npn \block_debug_off:
610 {
611   \bool_gset_false:N \g__block_debug_bool
612   \__block_debug_gset:
613 }

614 \cs_new_protected:Npn \__block_debug_gset:
615 {
616   \cs_gset_protected:Npe \__block_debug:n ##1
617   { \bool_if:NT \g__block_debug_bool {##1} }
618   \cs_gset_protected:Npe \__block_debug_typeout:n ##1
619   { \bool_if:NT \g__block_debug_bool
620     { \iow_term:e { ^~J [Blocks]~ ==>~ ##1} } }
621 }

```

(End of definition for `\block_debug_on:`, `\block_debug_off:`, and `\__block_debug_gset:`. These functions are documented on page 39.)

```

\DebugBlocksOn  If we are debugging blocks we also want to know about template instances, so we turn
\DebugBlocksOff the debugging for templates as well (for now).

622 \cs_new_protected:Npn \DebugBlocksOn { \block_debug_on: \DebugTemplatesOn }
623 \cs_new_protected:Npn \DebugBlocksOff { \block_debug_off: \DebugTemplatesOff }

624 \DebugBlocksOff

```

(End of definition for `\DebugBlocksOn` and `\DebugBlocksOff`. These functions are documented on page 39.)

`\DebugSwitchesOn` This debugs the use of legacy switches (so perhaps better called `\DebugLegacySwitchesOn`)
`\DebugSwitchesOff` but so far it was just a quick debugging aid while I was trying to understand. It needs some further thoughts and is probably not necessary at all in the end.

```

625 \cs_new_protected:Npn \DebugSwitchesOn {
626   \AddToHookWithArguments{cmd/legacy_if_gset_false:n/before}[debug]
627   {\typeout{[Switch]~==>~ ##1~==false~(global)}}
628   \AddToHookWithArguments{cmd/legacy_if_gset_true:n/before}[debug]
629   {\typeout{[Switch]~==>~ ##1~==true~(global)}}
630   \AddToHookWithArguments{cmd/legacy_if_set_false:n/before}[debug]
631   {\typeout{[Switch]~==>~ ##1~==false}}
632   \AddToHookWithArguments{cmd/legacy_if_set_true:n/before}[debug]
633   {\typeout{[Switch]~==>~ ##1~==true}}
634 }

635 \cs_new_protected:Npn \DebugSwitchesOff {
636   \RemoveFromHook{cmd/legacy_if_gset_false:n/before}[debug]
637   \RemoveFromHook{cmd/legacy_if_gset_true:n/before}[debug]
638   \RemoveFromHook{cmd/legacy_if_set_false:n/before}[debug]
639   \RemoveFromHook{cmd/legacy_if_set_true:n/before}[debug]
640 }

```

```

641 %\DebugSwitchesOn
642 %\DebugSwitchesOff

```

(End of definition for `\DebugSwitchesOn` and `\DebugSwitchesOff`. These functions are documented on page ??.)

9.2 Template types and template interfaces

This section is devoted to the template interfaces, and the template code is covered later.

`blockenv` (*type*) All template types expect a first key–value argument used to tweak template parameters
`list` (*type*) at a specific point in the document for a single environment or command. The template
`captionedtext` (*type*) types `blockenv`, `list`, `captionedtext`, and `thmstyle` take three more arguments which
`thmstyle` (*type*) are a boolean for suppressing numbering, a possible caption, and a possible sub-caption.

```

block (type)
  block (type) 643 \NewTemplateType{blockenv}{4}
  item (type) 644 \NewTemplateType{list}{4}
  para (type) 645 \NewTemplateType{captionedtext}{4}
               646 \NewTemplateType{thmstyle}{4}

647 \NewTemplateType{block}{1}
648 \NewTemplateType{item}{1}
649 \NewTemplateType{para}{1}

```

`blockenv std` (*templ.*)

```

650 \DeclareTemplateInterface{blockenv}{std}{4}
651 {
652   name : tokenlist

```

If not explicitly set then `tag-name` and `tag-attr-class` are set by the `tagging-recipe`. However, we have to default both to `<empty>` so that nested blocks do not inherit from the outer level.

```

653 ,tag-name : tokenlist =
654 ,tag-attr-class : tokenlist =
655 ,tagging-recipe : tokenlist = standard
656 ,transparent-level : boolean = false
657 ,early-legacy-code : tokenlist =
658 ,late-legacy-code : tokenlist =
659 ,block-instance : tokenlist = std-display

```

Paragraph instance is normally inherited so no default.

```

660 ,para-instance : tokenlist
661 ,inner-level-counter : tokenlist
662 ,max-inner-levels : tokenlist = 4
663 ,inner-instance-type : tokenlist =
664 ,inner-instance : tokenlist =
665 ,tagging-suppress-paras : boolean = false
666 ,final-code : tokenlist = \ignorespaces
667 ,standalone : boolean = false
668 }

```

`block std` (*templ.*)

```

669 \DeclareTemplateInterface{block}{std}{1}{
670   ,begin-vspace : skip = \topsep

```

```

671 ,begin-extra-vspace      : skip = \partopsep
672 ,begin-unchained-vspace  : skip = .5\topsep
673 ,para-vspace             : skip = \parskip
674 ,end-vspace              : skip = \KeyValue{begin-vspace}
675 ,end-extra-vspace        : skip = \KeyValue{begin-extra-vspace}
676 ,item-vspace             : skip = \itemsep
677 ,begin-penalty           : integer = \UseName{@beginparpenalty}
678 ,end-penalty             : integer = \UseName{@endparpenalty}
679 ,item-penalty            : integer = \UseName{@itempenalty}
680 ,left-margin             : length = \leftmargin
681 ,right-margin            : length = \rightmargin
682 ,para-indent             : length = 0pt
683 }

```

para std (*templ.*)

```

684 \DeclareTemplateInterface{para}{std}{1}{
685   ,para-attr-class       : tokenlist = justify
686   ,para-indent           : length = \parindent
687   ,begin-hspace          : skip = 0pt
688   ,left-hspace           : skip = 0pt
689   ,right-hspace          : skip = 0pt
690   ,end-hspace            : skip = \@flushglue
691   ,fixed-word-spaces     : boolean = false
692   ,final-hyphen-demerits : integer = 5000
693   ,newline-cmd           : function(0) = \@normalcr
694 }

```

list std (*templ.*)

```

695 \DeclareTemplateInterface{list}{std}{4}{
696   counter               : tokenlist =
697   ,item-label           : tokenlist =
698   ,start                : integer = 1
699   ,resume               : boolean = false
700   ,item-instance        : instance{item} = basic
701   ,item-vspace          : skip = \itemsep
702   ,item-penalty         : integer = \UseName{@itempenalty}
703   ,item-indent          : length = \itemindent
704   ,label-width          : length = \labelwidth
705   ,label-sep            : length = \labelsep
706   ,legacy-support       : boolean = false
707 }

```

item std (*templ.*)

```

708 \DeclareTemplateInterface{item}{std}{1}{
709   counter-label         : function{1} = \arabic{#1}
710   ,counter-ref          : function{1} = \KeyValue{counter-label}
711   ,label-ref            : function{1} =
712   ,label-autoref        : function{1} = item~#1
713   ,label-format         : function{1} = #1
714   ,label-strut          : boolean = false
715   ,label-align          : choice {left,center,right,parleft} = right
716   ,label-boxed          : boolean = true
717   ,next-line            : boolean = false      % <- review viz standalone below
718   ,text-font            : tokenlist

```

```

719 ,compatibility : boolean = true
720 ,label-placement : choice {chained,unchained,standalone} = chained ,
721 }

```

`captionedtext thmlike` (*templ.*) The `captionedtext thmlike` template for theorem-like environments has only six keys because it delegates most of the work to the `thmstyle` template specified in the key `style`.

```

722 \DeclareTemplateInterface{captionedtext}{thmlike}{4}{
723   ,numbered      : boolean = true
724   ,counter       : tokenlist =
725   ,number        : tokenlist = \NoValue
726   ,title         : tokenlist = \NoValue      % <- bad name?
727   ,note         : tokenlist = \NoValue
728   ,style         : instance{thmstyle} = plain
729 }

```

`captionedtext proof` (*templ.*) In contrast, the `captionedtext proof` template implements all of the `proof` environment without any delegation and therefore shows several keys for customizing the layout (similar to those seen with `thmstyle std`).

```

730 \DeclareTemplateInterface{captionedtext}{proof}{4}{
731   title          : tokenlist = \proofname
732   ,punct         : tokenlist = .
733   ,note         : tokenlist = \NoValue
734   ,separator     : tokenlist = \
735   ,order         : commalist = {title,separator,note,punct}
736   ,caption-placement : choice {chained,unchained,standalone} = unchained
737   ,caption-unbreakable : boolean = false
738   ,before-hspace  : skip = 0pt
739   ,after-hspace   : skip = 5pt
740   ,caption-decls  : tokenlist =
741   ,title-decls    : tokenlist =
742   ,note-decls     : tokenlist =
743   ,punct-decls    : tokenlist =
744   ,title-format   : function{1} = #1
745   ,punct-format   : function{1} = \AddPunct{#1}
746   ,note-format    : function{1} = (#1)
747   ,body-decls     : tokenlist =
748 }

```

`\proofname` The `amsthm` package supported redefinition of `\proofname` as a means to alter default caption for proofs. We continue to support this as long as the instance declaration doesn't overwrite it.

```

749 \newcommand\proofname{Proof}

```

(End of definition for `\proofname`. This function is documented on page ??.)

`thmstyle std` (*templ.*)

```

750 \DeclareTemplateInterface{thmstyle}{std}{4}{
751   separator      : tokenlist = \
752   ,separator-a    : tokenlist = \
753   ,separator-b    : tokenlist = \
754   ,punct         : tokenlist = .
755   ,caption-placement : choice {chained,unchained,standalone} = unchained

```

```

756 ,caption-unbreakable : boolean = false
757 ,before-hspace       : skip = 0pt
758 ,after-hspace        : skip = 5pt
759 ,order                : commalist = {title,separator-a,number,punct,
760                                     separator-a,note}
761 ,caption-decls        : tokenlist =
762 ,title-decls          : tokenlist =
763 ,number-tag           : tokenlist = \UseStructureName{block/theorem-like/label}
764 ,number-decls         : tokenlist =
765 ,punct-decls          : tokenlist =
766 ,note-decls           : tokenlist =
767 ,title-format         : function{1} = #1
768 ,number-format        : function{1} = #1
769 ,punct-format         : function{1} = \AddPunct{#1}
770 ,note-format          : function{1} = (#1)
771 ,body-decls           : tokenlist  =
772 }

```

9.3 Implementation of templates

9.3.1 Some notes on the L^AT_EX 2_ε legacy switches

L^AT_EX 2_ε used a number of switches to manage its list environments and everything that was based on them.

For the reimplementaion I made some notes about the original usage and how this got changed (while keeping the names for now).

Some of these switches really need to keep their names, e.g., `@nobreak` or `minipage`, because they are used all over the place. Others can probably be replaced with L3 booleans which makes things faster and cleaner, but for now I kept them too.

9.3.1.1 Original usage:

```

773 %
774 % @newlist (global): signal that we are at the start of a list
775 %
776 % -> true   at the start of a list before the first item when control
777 %           is returned to document
778 % -> false  in everypar setting the first item
779 % -> false  at end of list if still true (after generating an error)
780 %
781 % -> tests: at list start setting @noprimitrue and @noprlisttrue
782 %
783 %
784 % @inlabel (global): signaling that some item label waits to be typeset
785 %
786 % -> true   in \@item
787 % -> false  at list end
788 % -> false  in everypar after label has been typeset
789 % -> false  in \newpage after \leavevmode to typeset item label
790 %           (probably not needed)
791 %
792 % -> tests: at list start setting @noprimitrue and @noprlisttrue
793 % -> tests: at list end to ensure that dangling label is typeset
794 % -> tests: in \@item to output a dangling item label by switching to hmode

```

```

795 % -> tests: in \everypar to output a dangling item label
796 % -> tests: in \newpage to output a dangling item label before the page is ended
797 % -> tests: in tagging hook {para/begin}{kernel}
798 %
799 %
800 % @noparlist (local):
801 %
802 % -> true   at start of list if already @inlabel=true
803 % -> false  at start of list otherwise
804 %
805 % -> tests: in \endtrivlist. If true suppress vertical spacing after the list
806 %
807 %
808 % @noparitem (local):
809 %
810 % -> true   at start of list if already @inlabel=true
811 % -> false
812 %

```

9.3.1.2 Repurpose:

```

813 %
814 % Interpret legacy switches as follows (keeping the names for now)
815 %
816 % @newlist   -> signals that we are at the start of a new block with a caption or
817 %              at the start of a list block expecting an item next
818 %
819 %              In other words this is now really start of a block
820 %              with inner structure.
821 %
822 % @noparlist -> signals that we are on a new block with @inlabel already true, i.e.,
823 %              and this placement should happen horizontally
824 %
825 % @inlabel   -> Signals that we have at least one item or caption waiting to be typeset
826 %              inside the label box
827 %
828 % @noparitem -> dropped (handled directly)
829 %

```

9.3.2 Implementation of blockenv templates

So far there is only one, but who knows ... — however, the majority will be vertically oriented blocks, so we make this the `std`.

`blockenv std (templ.)`

```

830 \DeclareTemplateCode{blockenv}{std}{4}{
831   name                = \l__block_env_name_tl
832   ,tag-name           = \l__block_tag_name_tl
833   ,tag-attr-class     = \l__block_tag_class_tl
834   ,tagging-recipe     = \l__block_tagging_recipe_tl
835   ,transparent-level  = \l__block_transparent_level_bool
836   ,early-legacy-code  = \l__block_early_legacy_code_tl
837   ,late-legacy-code   = \l__block_late_legacy_code_tl
838   ,block-instance     = \l__block_block_instance_tl

```

```

839 ,para-instance           = \l__block_para_instance_tl
840 ,tagging-suppress-paras = \l__tag_para_flattened_bool
841 ,inner-level-counter     = \l__block_inner_level_counter_tl
842 ,max-inner-levels       = \l__block_max_inner_levels_tl
843 ,inner-instance-type     = \l__block_inner_instance_type_tl
844 ,inner-instance         = \l__block_inner_instance_tl
845 ,final-code             = \l__block_final_code_tl
846 ,standalone             = \l__block_standalone_bool
847 }
848 { \template_debug_typeout:n{~\space template:~ 'std;~
849                                arguments:~ \exp_not:n{~|#1|#2|#3|#4|}}

```

For special legacy support we start with a hook that receives the `name` value as its argument (so that it contains code that is only executed for a specific name). Before calling this hook we also set `\UnusedTemplateKeys` to empty. In the hook code this macro can then be filled with key/value settings (for example, from `\setlist`) to be fed below into `\SetKnownTemplateKeys`.

```

850 \tl_set_eq:NN \UnusedTemplateKeys \c_empty_tl
851 \exp_args:Nno \hook_use:nnw {blockenv} 1 \l__block_env_name_tl

```

To the `\UnusedTemplateKeys` (empty or filled) we append any keys specified in the first argument to the template unless `#1` is empty or contains just `\NoValue`. This allows keys set on the document level to overwrite those set by `\setlist` and ultimately also those set in the instance.

```

852 \tl_if_empty:oF {#1}
853   { \tl_if_novaluenF {#1}

```

We expand `#1` once because the keys might be hidden in a user macro.

```

854   { \tl_set:Nc \UnusedTemplateKeys
855     { \exp_not:o \UnusedTemplateKeys \exp_not:o { #1 } }
856   }
857 }

```

Finally the key list stored in `\UnusedTemplateKeys` is then fed to `\SetKnownTemplateKeys` for evaluation. `\SetKnownTemplateKeys` applies all keys that apply to the `blockenv` template and saves those that don't back in `\UnusedTemplateKeys` to be applied to inner instances below. This is why we had to combine all keys and evaluate them in one go.

```

858 \SetKnownTemplateKeys {blockenv} {std} \UnusedTemplateKeys

```

The tagging recipe `standalone` implies that the `standalone` key is set to `true`.

```

859 \tl_if_eq:NnT \l__block_tagging_recipe_tl { standalone }
860   { \bool_set_true:N \l__block_standalone_bool }

```

If this is a standalone environment we ensure that there is an implicit `\par` before and after:

```

861 \bool_if:NFT \l__block_standalone_bool
862   { \__block_debug_endpe_typeout:n {===>~ standalone = true}

```

We can't simply issue a `\par` because the current environment may have set `tagging-suppress-paras` in which case a `\par` would not close the outer semantic para structure. We therefore temporarily set this boolean to false.

```

863 \bool_set_eq:NN \l__block_flattened_bool \l__tag_para_flattened_bool
864 \bool_set_false:N \l__tag_para_flattened_bool

```

```

865     \par
866     \bool_set_eq:NN \l__tag_block_flattened_bool \l__block_flattened_bool
867   }
868   { \__block_debug_endpe_typeout:n {===>~ standalone = true}
869   }

```

We need to know later if we have nested `blockenvs` inside a flattened environment. Whenever we start a new `blockenv` we increment `\l__tag_block_flattened_level_int` if it is already different from zero. If it is zero we increment it if flattening is requested. Thus a value of 0 means no flattening requested so far and 1 means this is the first `blockenv` requesting flattening. In either case we have to make sure that the `blockenv` is surrounded by a `<semantic-para>` tag, while for any value above 1 we have to omit the `<semantic-para>`.

```

870   \int_compare:nNnTF \l__tag_block_flattened_level_int > 0
871   { \int_incr:N \l__tag_block_flattened_level_int
872   }
873   { \bool_if:NT \l__tag_block_flattened_bool
874     { \int_incr:N \l__tag_block_flattened_level_int
875     }
876   }

877   \tl_if_empty:NF \l__block_inner_level_counter_tl
878   { \int_compare:nNnTF \l__block_inner_level_counter_tl >
879     { \l__block_max_inner_levels_tl - 1 }
880     { \@toodeep }
881     { \int_incr:N \l__block_inner_level_counter_tl } % not clean "o"?
882   }

```

Legacy defaults are only roped in if the list level changes. For display blocks that remain on the same level the current values are kept.

```

883   \int_compare:nNnTF \g_block_nesting_depth_int >
884     { \c@maxblocklevels - 1 }
885   { \@toodeep }
886   { \int_gincr:N \g_block_nesting_depth_int

```

If there are no legacy defaults for that level then the next line does nothing, i.e., the current values (from the last level) become the defaults for the next.

If have a transparent level (e.g., something like a `center` environment) we omit setting the legacy defaults, because that is the way $\text{\LaTeX} 2_{\epsilon}$ lists worked as well.

```

887     \bool_if:NF \l__block_transparent_level_bool
888     { \use:c { @list
889       \int_to_roman:n { \g_block_nesting_depth_int } }
890     }
891   }

```

If we are doing tagging we load one of the available recipes for tagging, which alters various kernel hooks to add appropriate tagging structures.

```

892   \UseTaggingSocket{block/recipe}{\l__block_tagging_recipe_tl}

```

The default for `list` environments is that they have an empty label and are not numbered (something that is then overwritten by the setup of a specific list). We ensure this here even for non-lists, because we need a defined state that then can be overwritten by the legacy setup code for the `list` environment in `\l__block_early_legacy_code_tl`.

This is needed in case lists are nested as they otherwise would inherit outer values (and suddenly an `itemize` would start incrementing an outer `enumerate` counter, etc.

```
893 \tl_clear:N \@itemlabel
894 \tl_clear:N \@listctr
895 \legacy_if_set_false:n { @nmbolist }
```

Then run the legacy setup code if any is given in the instance. We may still be in horizontal mode at this point so anything affecting paragraph parameters would alter preceding text!

```
896 \l_block_early_legacy_code_tl
```

Next call a block instance at the appropriate level passing it any remaining key/value from the optional document-level argument (i.e., those now stored in `\UnusedTemplateKeys`).

```
897 \exp_args:Nee \UseInstance {block}
898     { \l_block_block_instance_tl - \int_use:N
899       \g_block_nesting_depth_int }
900     \UnusedTemplateKeys
```

After this instance has been processed, any remaining unused keys are stored in `\UnusedTemplateKeys` and we can make use of this data later as long as we do not call another instance that also does unused key processing and overwrites it. But this is what happens below, so we better save its current value for now.

```
901 \tl_set_eq:NN \l_block_unused_blockenv_keys_tl \UnusedTemplateKeys
```

After the block instance call the para and then inner (list) instance if either or both are specified (which may not be the case).

```
902 \tl_if_empty:NF \l_block_para_instance_tl
903 {
```

For now we don't offer to alter instance parameters here so we pass an empty argument.

```
904     \exp_args:Nee \UseInstance {para}{ \l_block_para_instance_tl } {}
905 }
```

At this point we are in vertical mode in a display environment and we execute legacy setup code that should not appear in horizontal mode.

```
906 \l_block_late_legacy_code_tl
```

The inner instance may have its own levels or none depending on which the instance name differs. Again we pass it the optional key/value list.

```
907 \tl_if_empty:NF \l_block_inner_instance_tl
908 {
```

We expand the first two arguments so that we get proper names for template type and instance, because `\UseInstance` is not doing that for us in the right way.

```
909     \exp_args:Nee
910     \UseInstance{ \l_block_inner_instance_type_tl }
911     { \l_block_inner_instance_tl
912       \tl_if_empty:NF \l_block_inner_level_counter_tl
913         % not clean use "o"?
914         { - \int_use:N \l_block_inner_level_counter_tl }
915     }
916     \l_block_unused_blockenv_keys_tl
917     #2      % <-- \BooleanTrue or False
```

```

918             { #3 }      % <-- \NoValue or content
919             { #4 }      % <-- \NoValue or content

```

Again the instance may have processed a few keys from the so far unused keys, so we update `\l__block_unused_blockenv_keys_tl` to match the new reality.

```

920     \tl_set_eq:NN \l__block_unused_blockenv_keys_tl \UnusedTemplateKeys
921 }

```

At this point, the `\l__block_unused_blockenv_keys_tl` token list should either be empty or it should contain only keys that are suitable for the item template, but right now there is no code to test that can test the latter; it would help probably if we have an interface for this.

For now we handle that when the first item is encountered, but that isn't really clean.

```

922 % \tl_if_empty:NF \l__block_unused_blockenv_keys_tl
923 % {
924 %     % check if only item template keys remain
925 % }

```

If this is supposed to be a transparent block environment then we have to decrement the nesting level again so that nested environments think nothing is there.

```

926 \bool_if:NT \l__block_transparent_level_bool
927 { \int_gdecr:N \g_block_nesting_depth_int }

```

We finish off with `\l__block_final_code_tl` which defaults to `\ignorespaces` so that spaces between `\begin{...}` and the start of the text are ignored.

```

928 \l__block_final_code_tl
929 }

```

`\l__block_flattened_bool` Temp variable for standalone handling.

```

930 \bool_new:N \l__block_flattened_bool

```

(End of definition for `\l__block_flattened_bool`.)

blockenv (*hook*) For legacy support we want a hook with one argument (the name of the `blockenv` instance). This way code could be added that is conditional based on which instance is executed.

```

931 \NewHookWithArguments{blockenv}{1}

```

\BlockEnv To simplify the environment declarations later we provide two simple commands that invoke a `blockenv` instance. The matching counterpart to these commands is `\BlockEnvEnd` (defined below) that carries out all necessary action when a block environment ends.

\SimpleBlockEnv

```

932 \cs_new_protected:Npn \BlockEnv          % #1#2#3#4 implicit
933 { \UseInstance{blockenv} }

```

This here is the most common one that hides arguments 2–4 when they aren't needed, e.g., in a `center` environment.

```

934 \cs_new_protected:Npn \SimpleBlockEnv #1#2
935 { \UseInstance{blockenv}{#1}{#2} \BooleanFalse \NoValue \NoValue }

```

(End of definition for `\BlockEnv` and `\SimpleBlockEnv`. These functions are documented on page 40.)

\g_block_nesting_depth_int L^AT_EX 2_ε already has a counter to record the nesting depth of blocks, but we want our own name because it isn't really tied to “lists” any more. However, `\@listdepth` is really part of the legacy interface (for example `minipage` alters it to point to a different counter) so that we are stuck with using at least indirectly for now and the following line makes this look like an L3 integer variable but internally expands to `\@listdepth`:

```
936 \cs_new_protected:Npn \g_block_nesting_depth_int { \@listdepth } % a fake int
937                                     % for now
```

(End of definition for `\g_block_nesting_depth_int`. This function is documented on page 40.)

\l_block_unused_blockenv_keys_tl The token list that holds key values we haven't yet used while we are processing the instances in a block environment.

```
938 \tl_new:N \l_block_unused_blockenv_keys_tl
```

(End of definition for `\l_block_unused_blockenv_keys_tl`.)

\l_tag_block_flattened_level_int Count the levels of nested `blockenvs` starting with the first that is “flattened”. The counter is defined in `ltagging.dtx`, but until the next release 11/24 we set it up here too

```
939 \int_if_exist:NF \l_tag_block_flattened_level_int
940 {
941     \int_new:N \l_tag_block_flattened_level_int
942 }
```

(End of definition for `\l_tag_block_flattened_level_int`.)

\c@maxblocklevels A counter to increase or decrease the number of supported level. If increased, one needs to supply additional level instances.

```
943 \newcounter{maxblocklevels}
944 \setcounter{maxblocklevels}{6}
```

(End of definition for `\c@maxblocklevels`. This function is documented on page 40.)

\BlockEnvEnd The code executed when a `blockenv` ends is 99% the same for all `blockenvs` (at least up to now). Small differences exist, though. They are accounted for first in the conditionals. We make this a public command so that new block environments can be set up without the need to resort to L3 layer programming.

```
945 \cs_new_protected:Npn \BlockEnvEnd {
946     \__block_debug_typeout:n{blockenv~ common~ ending \on@line}
```

If this block is not a transparent one we have to decrement the level now again, otherwise that had happened earlier:

```
947     \bool_if:NF \l_block_transparent_level_bool
948     { \int_gdecr:N \g_block_nesting_depth_int }
```

If the `@inlabel` switch is true, i.e., if there is a caption or an item waiting to be placed we move to horizontal mode to get them typeset.

```
949     \legacy_if:nT { @inlabel }
950     {
951         \mode_leave_vertical:
952         \legacy_if_gset_false:n { @inlabel }
953     }
```

If we are ending a list environment and we have not seen any `\item`, i.e., `@newlist` is still true, we raise an error. In basic a “displayblock” scenario `@newlist` will always be false, but if such an environment appears inside an outer list then `\noitemerr` could still be triggered and that is undesirable (as the missing item will be detected at the wrong point and again later, during the outer list processing). We therefore run it only if the current environment is a list.

```

954 \__block_if_list:TF
955   { \legacy_if:nT { @newlist } { \noitemerr } }

```

If we aren’t in a list we check if there are still unused keys and in that case generate an error. In lists that is already done at each `\item` command.

```

956   {
957     \tl_if_empty:NF \UnusedTemplateKeys
958     {
959       \msg_error:nneo { block } { unknown-keys }
960       { \l_block_env_name_tl \space environment}
961       \UnusedTemplateKeys
962     }
963   }
964 \mode_if_horizontal:TF
965   { \__block_skip_remove_last: \__block_skip_remove_last: \par }
966   { \inmatherr{\end{\@currenvir}} }

```

Once we are back in vertical mode we can add the appropriate closing tagging structure(s), if we are doing tagging.

```

967 \__kernel_displayblock_end:

```

Resetting the `@newlist` switch is also only done if the current environment is a list.

```

968 \__block_if_list:T { \legacy_if_gset_false:n { @newlist } }

```

There is a possibility that the `@nobreak` switch is still true so we set it back just in case.

```

969 \legacy_if_gset_false:n { @nobreak }

```

What to do in terms of vertical spacing in different situations is still somewhat open to debate, right now this is more or less implementing what L^AT_EX 2_ε list environments have been doing.

```

970 % \__block_debug_typeout:n{@nparlist =
971 % \legacy_if:nTF { @nparlist }{true}{false}}
972 \legacy_if:nF { @nparlist }
973   { \__block_skip_set_to_last:N \l_tmpa_skip
974     \dim_compare:nNt \l_tmpa_skip > \c_zero_dim
975     { \skip_vertical:n { - \l_tmpa_skip }
976       \skip_vertical:n { \l_tmpa_skip + \parskip - \@outerparskip }
977     }
978     \addpenalty \@endparpenalty
979     \addvspace \l_block_effective_bot_skip

```

L^AT_EX 2_ε triggered the paragraph handling after a list at this point here, i.e., only if the list didn’t start a paragraph. One can make a case for that, but it can be somewhat surprising to the user and there is a good argument that even such a list could be followed explanatory text that is part of the same paragraph and doesn’t start a new one.

```

980 % \legacy_if_gset_true:n { @endpe }
981 }

```

some redesign/extensions here?

decide which logic we want to use! If the old logic is used we need to close the semantic-para ourselves in the true branch

decide

So this is for now always done. Probably `\l__block_effective_top_skip` above should be added only if the paragraph ends here and not if it continues, so this need some further cleanup.

Finally, we have the code that does the `\par` handling after the block. Normally, we continue the semantic paragraph, i.e., set `\@endpetrue` but there are some exceptions: If this is a standalone environment we need to issue a `\par`, but that has to happen after the environment in case the current blockenv has a special definition for `\par`.

```
982 \bool_if:NT \l__block_standalone_bool { \aftergroup \par }
```

If the `tagging-recipe` is `noop` we do not set `@endpe` at all so its value is whatever it was set to in the body of the environment (which may have ended in a list, for example).

```
983 \tl_if_eq:NnF \l__block_tagging_recipe_tl { noop }
```

If the `tagging-recipe` is `standalone` we set it to false. This is necessary because the `\par` is put in with `\aftergroup` and there is a subtle racing condition with the way the `@endpe` setting propagates out of groups (also using `\aftergroup`. As a result it would be again true after this implicit empty line resulting in havoc.

```
984 { \tl_if_eq:NnTF \l__block_tagging_recipe_tl { standalone }
985 \endpefalse
```

For all other recipes we can safely set it to true.

```
986 \endpetrue
987 }
988 }
```

(End of definition for `\BlockEnvEnd`. This function is documented on page 40.)

`\__block_if_list:T`
`\__block_if_list:TF`

The following code may need some redesigning, as there is no good test for “is this environment a ‘list’ that has `\items`”. For now this here does the trick well enough as `\items` are only supported if the `inner-instance-type` is `list`.

```
989 \cs_new:Npn \__block_if_list:T
990 { \tl_if_eq:NnT \l__block_inner_instance_type_tl {list} }
991 \cs_new:Npn \__block_if_list:TF
992 { \tl_if_eq:NnTF \l__block_inner_instance_type_tl {list} }
```

(End of definition for `\__block_if_list:T` and `\__block_if_list:TF`.)

`\__kernel_displayblock_end:`

The kernel hook for tagging at the end of the block. Without tagging it executes the `item/after` hook if inside a list, with active tagging it is overwritten by other commands in the recipes.

```
993 \cs_new_protected:Npn \__kernel_displayblock_end: {
994 \__block_if_list:T{\hook_use:n{item/after}}
995 \__block_debug_typeout:n{\detokenize{\__kernel_displayblock_end:}}
996 }
```

(End of definition for `\__kernel_displayblock_end:`.)

9.3.3 Implementation of para templates

para std (*templ.*)

```
997 \DeclareTemplateCode{para}{std}{1}{
998   para-indent          = \parindent
```

The next parameter needs integrating in the basic paragraph handling (not done yet) and it should therefore probably a public name like the rest.

integrate/fix

```
999   ,begin-hspace        = \l_para_begin_skip
1000   ,left-hspace         = \leftskip
1001   ,right-hspace        = \rightskip
1002   ,end-hspace          = \parfillskip
```

fix

Next isn't yet implemented (and the variable name is wrong).

```
1003   ,fixed-word-spaces   = \l__par_fixed_word_spaces_bool % name??
1004   ,final-hyphen-demerits = \finalhyphendemerits
1005   ,newline-cmd         = \
1006   ,para-attr-class      = \l__tag_para_attr_class_tl
1007 }
1008 { \template_debug_typeout:n{~\space template:~ 'std';~
1009                                     argument:~ \exp_not:n{||#1|}}
1010   \SetTemplateKeys{para}{std}{#1}
1011   \skip_set:Nn \@rightskip \rightskip
1012 }
```

`\__para_handle_indent:` We insert `\l_para_begin_skip` directly in front of the indentation box. This way it is hidden from any special setting of `\everypar` (whether that is used to remove the indentation box or whether it attempts to do something with the first token(s) of the paragraph). However, we only insert it if it differs from 0.0pt to avoid adding `\penalty 10000 \glue 0.0` all over the place.

```
1013 \tl_const:Nc \c__zero_skip_tl { \skip_use:N \z@skip }
1014 \tl_new:N \l__para_begin_skip_tl

1015 \cs_set:Npn \__para_handle_indent: {
1016   \tl_set:Nc \l__para_begin_skip_tl { \skip_use:N \l_para_begin_skip }
1017   \if_meaning:w \l__para_begin_skip_tl
1018     \c__zero_skip_tl
1019   \else:
1020     \nobreak
1021     \tex_hskip:D \l_para_begin_skip
1022   \fi:
1023   \box_use_drop:N \g_para_indent_box
1024 }
```

(End of definition for `\__para_handle_indent:`.)

`\para_raw_noindent:` `\para_raw_noindent:` doesn't call `\__para_handle_indent:` so we have to manually do the `\l_para_begin_skip` handling.

```
1025 \cs_set:Npn \para_raw_noindent: {
1026   \mode_if_vertical:TF
1027     {
1028       \tex_everypar:D {
1029         \tex_everypar:D { \g__para_standard_everypar_tl }
```

```

1030         \tl_set:Nc \l__para_begin_skip_tl { \skip_use:N \l_para_begin_skip }
1031         \if_meaning:w \l__para_begin_skip_tl
1032             \c__zero_skip_tl
1033         \else:
1034             \nobreak
1035             \tex_hskip:D \l_para_begin_skip
1036         \fi:
1037         \the\everypar }
1038     }
1039     { \msg_error:nn { latex2e }{ raw-para } }
1040 \tex_noindent:D
1041 }

```

(End of definition for `\para_raw_noindent:`. This function is documented on page ??.)

9.3.4 Implementation of block templates

`block std (templ.)` In contrast to the L^AT_EX 2_ε implementation we do not directly use `\listparindent` here but a private register of the template. The reason is that block template instances are also used outside of lists.

```

1042 \DeclareTemplateCode{block}{std}{1}{
1043     ,begin-vspace           = \topsep
1044     ,begin-extra-vspace     = \partopsep
1045     ,begin-unchained-vspace = \l__block_unchained_skip
1046     ,para-vspace           = \parsep
1047     ,end-vspace             = \l__block_botsep_skip
1048     ,end-extra-vspace       = \l__block_parbotsep_skip
1049     ,item-vspace            = \itemsep
1050     ,begin-penalty          = \@beginparpenalty
1051     ,end-penalty            = \@endparpenalty
1052     ,item-penalty           = \@itempenalty
1053     ,right-margin           = \rightmargin
1054     ,left-margin            = \leftmargin
1055     ,para-indent            = \l__block_parindent_dim
1056 }
1057 {
1058     \template_debug_typeout:n{~\space template:~ 'std';~
1059         argument:~ \exp_not:o{\exp_after:wN |#1|}}
1060     \SetKnownTemplateKeys{block}{std}{#1}

```

One aspect that needs a different handling is the management of `\par` after a block environment. If there is no empty line the following text is considered to be a continuation of the current paragraph. To manage this both `\par` and `\everypar` are redefined with the latter removing the paragraph indentation from the next paragraph. But if an empty line was seen after the block then the redefined `\par` would cancel the redefinition of `\everypar` so that the next paragraph again had its indentation. The other case in which the following indentation should not get suppressed is when two block environments directly follow each other. In the original L^AT_EX 2_ε implementation that simply worked because the `\item` command canceled any `\everypar` and all block environments were implemented as “lists”, i.e., contained an `\item`, even if it was only there to get the vertical spacing right. With the new block implementation this is no longer the case, so we have to handle the cancellation ourselves.

We can't simply use `\mode_if_vertical:T { \par }` because that would also end the semantic paragraph. Instead we check if `@endpe` handling is requested and if so reset `\everypar`.

```
1061 \legacy_if:nT { @endpe } { \everypar{} }
```

The remaining code largely follows the logic of $\text{\LaTeX 2}_\epsilon$'s `trivlist` implementation as far as it is applicable for the “display block” but coded using the L3 programming layer. However, we keep most of the legacy variables (e.g., `@noskipsec`) if there is some chance that they are set/used in classes or packages.

```
1062 \legacy_if:nTF { @noskipsec }
```

A `@noskipsec` heading is a heading that is placed in the same line as the following text (using `\everypar`) but not if that text starts with a display block, so we ensure that the heading gets typeset now.

```
1063 { \mode_leave_vertical: }
```

If no such heading is waiting we might have a block caption waiting to be typeset and this might be requested to be set “unchained”. In that case we also have to ensure that this gets typeset now.

The situation is slightly different though, because we want to end in vertical mode in that case also add some special vertical space and have to properly deal with avoiding page breaks.

```
1064 { \bool_if:NT \g__block_label_unchained_bool
1065   { \__block_debug_typeout:n{Set~ captioned~ block~ everypar \on@line }
1066     \cs_set_eq:NN \__block_everypar: \__block_captioned_everypar_std:
1067     \legacy_if:nT { @inlabel }
1068     { \hbox_unpack_drop:N \g__block_labels_box
1069       \legacy_if_gset_false:n { @inlabel }
1070       \par
1071       \nobreak
1072       \skip_vertical:n { \l__block_unchained_skip }
1073       \legacy_if_gset_true:n { @nobreak }
1074     }
1075   }
1076 }
```

The variable `\l__block_effective_top_skip` is used for the vertical skip at the start. It is initialized with `begin-vspace` and below we add `begin-extra-vspace` if the block starts in vmode and is not part of an ongoing semantic paragraph.

```
1077 \skip_set:Nn \l__block_effective_top_skip { \topsep }
```

For the vertical space at the end we do something similar.

```
1078 \skip_set:Nn \l__block_effective_bot_skip { \l__block_botsep_skip }
1079 \mode_if_vertical:TF
1080 {
```

If `@endpe` is `true` then we are in the situation that a display environment wants to continue the current semantic paragraph, so we do not add `\partopsep` or `\l__block_-parbotsep_skip` in that case.

```
1081 \legacy_if:nF { @endpe }
1082 { \skip_add:Nn \l__block_effective_top_skip { \partopsep }
```

This is similar to the standalone case for block captions so perhaps that can be combined, check

```

1083         \skip_add:Nn \l__block_effective_bot_skip
1084             { \l__block_parbotsep_skip }
1085     }

```

At this point it is safe to add tagging structure(s) so we have a kernel-owned hook here for tagging. This is used to possibly start a paragraph structure (to surround the block, for example, in case of lists) and possibly do some other preparation for tagging the block.

```

1086     \__kernel_displayblock_beginpar_vmode:
1087 }

```

If we are in horizontal mode then the displayblock has to return to vertical mode now (after removing any immediately preceding skip or kern. But before we actually issue the `\par` we execute a kernel hook in which we can add tagging code. This hook is “weird” because by default it does nothing, but if tagging is wanted it takes an argument and grabs the following `\par` in order to put tagging code before and after the `\par`.

```

1088     { \__block_skip_remove_last: \__block_skip_remove_last:
1089       \__kernel_displayblock_beginpar_hmode:w \par
1090     }

```

Next lines set some paragraph defaults, any of them may get overwritten if there is a `para-instance` specified on the `blockenv` instance.

```

1091     \skip_zero:N \leftskip
1092     \skip_set_eq:NN \rightskip \@rightskip
1093     \skip_set_eq:NN \parfillskip \@flushglue

```

The next lines establish a parshape which is retained across paragraphs by executing `\para_end:` within a group and thus reestablishing the parshape for the next paragraph again. In case a list got started `\par` is ignored until we have seen an `\item` (or we have executed `\par` one thousand times.

```

1094     \int_zero:N \par@deathcycles
1095     \setpar
1096     { \legacy_if:nTF { @newlist }
1097       { \int_incr:N \par@deathcycles
1098         \int_compare:nNnTF \par@deathcycles > { 1000 }
1099           { \@noitemerr
1100             { \para_end: }
1101           }
1102       }
1103     {
1104       { \para_end: }
1105     }
1106   }

1107     \dim_set_eq:NN \parindent \l__block_parindent_dim
1108     \dim_add:Nn \linewidth { - \rightmargin - \leftmargin }
1109     \dim_add:Nn \@totalleftmargin { \leftmargin }
1110     \tex_parshape:D 1 ~ \@totalleftmargin \linewidth

```

This is the point where we are ready to add the tagging structure for the block, e.g., an `<L>`, a `<Figure>` or some other structure.

```

1111     \__kernel_displayblock_begin:

```

Finally, we have to output the vertical separation and penalty at the start of the block and make corrections for a change in `\parskip` and some other housekeeping, unless this block is inside a list and the list `\item` has not yet placed. In that case the vertical space and penalty is suppressed. This is controlled through the legacy switches `@inlabel`, `minipage`, and `@nobreak`.

Now we are back to legacy list implementation ...

```

1112     \skip_set_eq:NN \@outerparskip \parskip
1113     \skip_set_eq:NN \parskip \parsep
1114 %
1115     \legacy_if:nTF { @inlabel }
1116     { \legacy_if_set_true:n { @noparlist }
1117       \hbox_gset:Nn \g__block_labels_box
1118       { \skip_horizontal:n { - \leftmargin }
1119         \hbox_unpack_drop:N \g__block_labels_box
1120         \skip_horizontal:n { \leftmargin }
1121       }
1122
1123       \legacy_if:nF { @minipage } % Why this chunk of code?
1124       { \__block_skip_set_to_last:N \l__block_tmpa_skip
1125         \skip_vertical:n { - \l__block_tmpa_skip }
1126         \skip_vertical:n { \l__block_tmpa_skip +
1127           \@outerparskip - \parsep }
1127     }
1128   }
1129   { \legacy_if_set_false:n { @noparlist }
1130     \legacy_if:nT { @newlist } { \noitemerr }
1131     \legacy_if:nTF { @nobreak }

```

document 2e logic used
here

We are not resetting `@nobreak` here as it should also apply to the upcoming item.

```

1132     { \addpenalty{ 10000 }
1133       \addvspace{ \skip_eval:n{\@outerparskip-\parsep} }
1134     }
1135     { \addpenalty \@beginparpenalty
1136       \addvspace { \skip_eval:n { \l__block_effective_top_skip +
1137         \@outerparskip } }
1138       \addvspace { - \parsep }
1139     }
1140   }
1141 }

```

`\__block_captioned_everypar_std:` The captioned text is typeset at the start of a paragraph using code triggered in `\everypar` (by setting `\__block_everypar` to this code here). It also sets `\l__block_body_decls_tl` because that needs to be delayed until the caption is placed. Otherwise a color setting would leak backwards into the caption.

```

1142 \cs_new_protected:Npn \__block_captioned_everypar_std: {
1143   \__block_debug_typeout:n{...~ in~ captioned~ block~ everypar \on@line }

```

First set some control switches to false:

```

1144     \legacy_if_set_false:n { @minipage }
1145     \legacy_if_gset_false:n { @newlist }

```

The `@inlabel` is normally true at this point, but if we also have `@nobreak` then the same routine is called again at the next paragraph to reset `\clubpenalty` and at that point the `\g__block_labels_box` has been typeset and `@inlabel` is false.

```
1146 \legacy_if:nT { @inlabel }
```

Typeset the saved label (aka captioned text):

```
1147 { \legacy_if_gset_false:n { @inlabel }
1148 \para_omit_indent:
1149 \bool_if:NTF \l__block_caption_unbreakable_bool
1150 \box_use_drop:N
1151 \hbox_unpack_drop:N
1152 \g__block_labels_box
1153 \__kernel_list_label_after:n { \PARALABEL } % <- change
1154 % this name
1155 \penalty \c_zero_int
1156 }
```

If `@nobreak` is true we prevent a break after the first line by setting `\clubpenalty`.

```
1157 \legacy_if:nTF { @nobreak }
1158 {
1159 \legacy_if_gset_false:n { @nobreak }
1160 \int_set:Nn \clubpenalty { 10000 }
1161 }
1162 {
```

Otherwise we reset `\clubpenalty` and disable `\__block_everypar`.

```
1163 \int_set_eq:NN \clubpenalty \@clubpenalty
1164 \__block_debug_typeout:n{Set~ noop~ block~ everypar \on@line }
1165 \cs_set_eq:NN \__block_everypar: \prg_do_nothing:
1166 }
```

Now the delayed value of the `body-decls` key. Problem is, the code here might be issued as part of a `block` template (that doesn't have that key). If such a block is the first thing in a `captionedtext` body then it is correct to use it, but if it happens later within a body then settings may have already changed locally and we should not bring them back. So as a precaution we clear the value after use.

```
1167 \l__block_body_decls_tl
1168 \tl_clear:N \l__block_body_decls_tl
1169 }
```

(End of definition for `\__block_captioned_everypar_std:`.)

```
\__kernel_displayblock_begin:
\__kernel_displayblock_beginpar_hmode:w
\__kernel_displayblock_beginpar_vmode:
```

The internal kernel hooks for tagging.

```
1170 \cs_new_protected:Npn \__kernel_displayblock_begin: {
1171 \__block_debug_typeout:n
1172 {\detokenize{\__kernel_displayblock_begin:}}
1173 }

1174 \cs_new_protected:Npn \__kernel_displayblock_beginpar_hmode:w {
1175 \__block_debug_typeout:n
1176 {\detokenize{\__kernel_displayblock_beginpar_hmode:w}}
1177 }
```

```

1178 \cs_new_protected:Npn \__kernel_displayblock_beginpar_vmode: {
1179   \__block_debug_typeout:n
1180   {\detokenize{\__kernel_displayblock_beginpar_vmode:}}
1181 }

```

(End of definition for `\__kernel_displayblock_begin:`, `\__kernel_displayblock_beginpar_hmode:w`, and `\__kernel_displayblock_beginpar_vmode:.`)

9.3.5 Implementation of list templates

This list is one of the template types that can be used as an inner-type in a `blockenv`; the other one currently implemented is `captionedtext`.

`\@itemlabel` Both `\@itemlabel` and `\@listctr` from the L^AT_EX 2_ε list implementation are used (or set) by various packages. We therefore use them too, so that these packages have a fighting chance to work with the new tagging-aware implementation for `list`.

```

1182 \tl_new:N \@itemlabel      % should have a top-level definition
1183 \tl_new:N \@listctr        % should have a top-level definition

```

(End of definition for `\@itemlabel` and `\@listctr`. These functions are documented on page 40.)

`\__block_evaluate_saved_user_keys:nn`

Keys set on individual list environments may be intended to alter the behavior of the template instance that defines the `\item` command. If meant to alter only a single `\item` command one would specify them in the optional argument of the `\item`, but if they should alter all items the right place would be the list environment. For this reason we need to store the values and then set them inside the `\item` template code using `\SetKnownTemplateKeys` in the appropriate context (template type and template name). This is done in `\__block_evaluate_saved_user_keys:nn`. The context is provided in the two arguments (because different list environments may use different `\item` instances based on different templates. By default the command does nothing because most environments do not have user key settings.

```

1184 \cs_new_eq:NN \__block_evaluate_saved_user_keys:nn \use_none:nn

```

Maybe something like this should become a public function, but for now this is a one-off for the `\item` command and therefore coded inline and internal to the block code.

```

1185 %\cs_new:Npn \__block_save_user_keys:n #1 {
1186 %  \tl_if_empty:nTF {#1}
1187 %    { \cs_set_eq:NN \__block_evaluate_saved_user_keys:nn \use_none:nn }
1188 %    { \cs_set:Npe \__block_evaluate_saved_user_keys:nn ##1##2
1189 %      { \SetKnownTemplateKeys{##1}{##2}{\exp_not:n{#1}} } }
1190 %}

```

(End of definition for `\__block_evaluate_saved_user_keys:nn`.)

`list std (templ.)`

This template implements numbered and unnumbered lists and can be combined with display blocks or with inline blocks.

```

1191 \DeclareTemplateCode{list}{std}{4}{
1192   counter      = \l__block_counter_tl
1193   ,item-label   = \l__block_item_label_tl
1194   ,start        = \l__block_counter_start_int
1195   ,resume       = \l__block_resume_bool
1196   ,item-instance = \__block_item_instance:n
1197   ,item-vspace  = \itemsep

```

```

1198 % ,item-para-vspace = \parsep
1199 ,item-penalty = \@itempenalty
1200 ,item-indent = \itemindent
1201 ,label-width = \labelwidth
1202 ,label-sep = \labelsep
1203 ,legacy-support = \l_block_legacy_support_bool % FMI questionable
1204 }
1205 { \template_debug_typeout:n{~\space template:~ 'std';~
1206 arguments:~ \exp_not:o{\exp_after:wN |#1|#2|#3|#4|}}

```

We start by looking at the user supplied keys in #1. If there aren't any we reset `\_block_evaluate_saved_user_keys:nn` to do nothing. Otherwise we evaluate and set the keys in the context of the current list template. In addition we prepare `\_block_evaluate_saved_user_keys:nn` for execution in the template for `\item`.

```

1207 \tl_if_empty:oTF {#1}
1208 { \cs_set_eq:NN \_block_evaluate_saved_user_keys:nn \use_none:nn }
1209 {
1210 \SetKnownTemplateKeys{list}{std}{#1}

```

The setup for `\_block_evaluate_saved_user_keys:nn` is a bit tricky and has to be done with `\cs_set:Npe` even though we don't want to expand anything and therefore use `\exp_not:n` inside. All this does is that any # passed in via #1 is doubled (e.g., from `label-format=\fbox{#1}` which is represented as `...\fbox{##1}`). Otherwise, we would end up with a replacement text like

```
\SetTemplateKeys {#1}{#2}{label-format=\fbox {#1}}
```

instead of

```
\SetTemplateKeys {#1}{#2}{label-format=\fbox {##1}}
```

resulting in very odd and puzzling behavior later on.

The definition of `\_block_evaluate_saved_user_keys:nn` made here is later used when an `\item` is processed and passes remaining keys to the item instance. After that nothing should remain, so we test that and issue an error if not.

```

1211 \cs_set:Npe \_block_evaluate_saved_user_keys:nn ##1##2
1212 { \SetKnownTemplateKeys{##1}{##2}{
1213 \exp_not:o { \UnusedTemplateKeys }
1214 }
1215 \exp_not:n {
1216 \tl_if_empty:NF \UnusedTemplateKeys
1217 { \msg_error:nneo { block } { unknown-keys }
1218 { \l_block_env_name_tl \space environment}
1219 \UnusedTemplateKeys
1220 }
1221 }
1222 }
1223 }

```

Has this list a counter name defined in the instance?

```

1224 \tl_if_empty:NTF \l_block_counter_tl
1225 {

```

If no counter name has been specified as part of the instance setup the list might still be numbered if it is a legacy list that uses `\usecounter` in the second argument of the legacy `list` environment. However, in that case we don't have to do much because `\usecounter` sets up `\@listctr` and sets it to zero so that the first item is numbered 1.

So all we do is to check if there was a `start` value given that differs from 1 and if so we change the counter value to match that. This makes it possible to define a legacy `list` in which the counter doesn't start with 1 by explicitly setting the counter value in the second argument of the `list` environment but also overwriting that through a `start` key setting on invocation.

```

1226     \int_compare:nNf \l__block_counter_start_int = 1
1227     { \int_gset:cn{ c@ \@listctr }
1228       { \l__block_counter_start_int - 1 }
1229     }
1230 }

```

In that case we only check if we should resume a previous list (`\@listctr` should be set in that case through the legacy method as well so we should be able to use it).

If a counter is set in the list instance we use that one. This should be the name of a `LaTeX` counter that is already allocated externally—no runtime check is made for this: if it is not declared one will get “no such counter” error when the list is used.

```

1231     { \@nbrlisttrue
1232       \tl_set_eq:NN \@listctr \l__block_counter_tl
1233       \bool_if:NF \l__block_resume_bool
1234       { \int_gset:cn{ c@ \@listctr }
1235         { \l__block_counter_start_int - 1 }
1236       }
1237 }

```

Does the current instance have an item label representation? This would be possible whether or not we have a numbered list. If yes, then we use this for `\@itemlabel`, otherwise we expect that `\@itemlabel` is provided from the outside, e.g., as part of the `list` environment argument.

```

1238     \tl_if_empty:NF \l__block_item_label_tl
1239     { \tl_set_eq:NN \@itemlabel \l__block_item_label_tl
1240     }

```

Finally, we signal that we are at the start of a new list (which affects how the first `\item` is handled and how `\par` commands are interpreted).

```

1241     \legacy_if_gset_true:n { @newlist }

```

If we encounter horizontal material before the first `\item` we do want a `\@noitemerr` straight away, because afterwards we end up with tagging structure faults whose cause is the missing `\item`. So we set up `\__block_everypar:` to test for this; when the first `\item` is encountered this will get reset. This is only relevant for vertical lists, when dealing with inline lists one would need to test for something else to identify that there is horizontal material between the start of the list and the first `\item` (maybe some `\spacefactor` trick could be used then, or the material is boxed first and the width is inspected as suggested by Joseph).

```

1242     \__block_debug_typeout:n{Set~ first~ block~ everypar \on@line }
1243     \cs_set_eq:NN \__block_everypar: \__block_item_everypar_first:

```

Think about a better implementation at some point.

```

1244 \_block_debug_typeof:n{template:list:std~end}
1245 }

```

The message that is used above when we are left with keys that are unknown:

```

1246 \msg_new:nnnn { block } { unknown-keys }
1247 { Some~ keys~ specified~ on~ the~ #1~ are~ unknown. }
1248 { The~ following~ keys~ are~ unknown~ and~ their~
1249   values~ are~ ignored:\\
1250   \space\space \exp_not:n {#2}\\
1251   Perhaps~ a~ misspelling~ or~ the~ current~ template~
1252   instance~ uses~ special~ keys.
1253 }

```

We need a special variant to expand `\UnusedTemplateKeys` once when passed as the last argument as the key values can contain stuff that doesn't react nicely under expansion.

```

1254 \cs_generate_variant:Nn \msg_error:nnnn {nneo}

```

9.3.6 Implementation of item templates

`item std (templ.)` The item template has one hidden key `label` which is not available on the template for setting because it is only used to receive any optional data passed to the `\item` command. We therefore declare it with `\keys_define:nn` and ensure that the optional argument data to `\item` (if it is not a key/value list already) is passed to this `label` key.

```

1255 \keys_define:nn { template/item/std }
1256   { label .tl_set:N = \l_block_label_given_tl }
1257 \DeclareTemplateCode{item}{std}{1} {
1258   counter-label = \_block_counter_label:n
1259   ,counter-ref  = \_block_counter_ref:n
1260   ,label-ref    = \_block_label_ref:n
1261   ,label-autoref = \_block_label_autoref:n
1262   ,label-format = \_block_label_format:n
1263   ,label-strut  = \l_block_label_strut_bool
1264   ,label-boxed  = \l_block_label_boxed_bool
1265   ,next-line    = \l_block_next_line_bool
1266   ,text-font    = \l_block_text_font_tl
1267   ,compatibility = \l_block_item_compatibility_bool

```

alignment is mostly wrong
(test short medium and
multiline labels)

next set of key not yet
used

complete

This probably needs a different implementation (and needs completing)

```

1268   ,label-align = {
1269     left   = \tl_set:Nn \l_block_item_align_tl { \relax \hss } ,
1270     center = \tl_set:Nn \l_block_item_align_tl { \hss \hss } ,
1271     right  = \tl_set:Nn \l_block_item_align_tl { \hss \relax } ,
1272     parleft = \NOT_IMPLEMENTED ,
1273   }

```

The keylabel-placement is implemented using two booleans (at the moment).

```

1274   ,label-placement = {
1275     chained    = \bool_gset_false:N \g_block_label_standalone_bool
1276                 \bool_gset_false:N \g_block_label_unchained_bool ,
1277     unchained  = \bool_gset_false:N \g_block_label_standalone_bool
1278                 \bool_gset_true:N  \g_block_label_unchained_bool ,

```

```

1279     standalone = \bool_gset_true:N \g__block_label_standalone_bool
1280                 \bool_gset_false:N \g__block_label_unchained_bool ,
1281   }
1282 }

```

Then typeset the label at its natural width by applying `\__block_make_label_box:n` to the label given or to a label constructed from the counter. If it is boxed and reasonably short, add padding to make it at least of size `\labelwidth`, then add another layer of box. This way, when we unpack it in `\g__block_labels_box` it correctly remains boxed in those cases. Afterwards, in the `nextline` case add `\newline` if the label did not fit in the allotted space.

```

1283 { \template_debug_typeout:n{~\space template:~ 'std';~
1284   argument:~ \exp_not:n{|\#1|}}

```

First deal with the key-value input, which in particular may provide a value for the label (the usual optional argument of `\item`). For this we set `\l__block_label_given_tl` to `\c_novalue_tl` so that we can identify if an optional argument was given.

```

1285 \tl_set_eq:NN \l__block_label_given_tl \c_novalue_tl

```

First we evaluate and set any keys specified on the list environment by calling `\__block_evaluate_saved_user_keys:nn`. This generates an error if not all key can be used, but it should really do so only on the first item. TODO: improve error handling!

Then we do the same with all keys specified on this `\item` command (which may overwrite one or the other setting just made).

```

1286 \__block_evaluate_saved_user_keys:nn {item}{std}

```

We don't care whether all of the user keys from the list level have been applied, but those explicitly set on the `\item` command should be applicable, so we generate an error if that isn't the case:

```

1287 \SetKnownTemplateKeys{item}{std}{\#1}
1288 \tl_if_empty:NF \UnusedTemplateKeys
1289   { \msg_error:nneo { block } { unknown-keys }
1290     { \exp_not:N \item command }
1291     \UnusedTemplateKeys
1292   }

```

If no optional argument was given then `\l__block_label_given_tl` is still equal to `\c_novalue_tl` and so we can distinguish that from `\item[]`.

```

1293 \tl_if_novalue:oTF \l__block_label_given_tl

```

The rest of the code for this template needs work and is both incomplete and partly wrong.

```

1294 { \tl_if_blank:oF \@listctr { \kernel@refstepcounter \@listctr }
1295   \bool_if:NTF \l__block_item_compatibility_bool % not sure that
1296                                                     % conditional
1297                                                     % makes sense
1298   { \__block_make_label_box:n { \MakeLinkTarget[\@listctr]{}%
1299     \@itemlabel } } % TODO ?
1300   { \__block_make_label_box:n { \MakeLinkTarget[\@listctr]{}%
1301     \__block_counter_label:n { \@listctr } } }
1302 }

```

next line needs checking
after NoValue implementa-
tion was changed

fix

```

1303 { \__block_debug_typeout:n{item~ with~ optional}
1304   \__block_make_label_box:n {
1305     \MakeLinkTarget [\l__block_env_name_tl]}

1306     \exp_args:No\__block_label_ref:n {\l__block_label_given_tl}
1307     \l__block_label_given_tl
1308   }
1309   \exp_args:No\__block_label_ref:n {\l__block_label_given_tl}
1310 }
1311 \bool_if:nT
1312 { \l__block_label_boxed_bool
1313 %   TODO: is \linewidth correct?
1314   && \dim_compare_p:n
1315     { \box_wd:N \l__block_one_label_box <= \linewidth }
1316 }
1317 { \dim_compare:nNnT
1318   { \box_wd:N \l__block_one_label_box } < \linewidth
1319   { \hbox_set_to_wd:Nnn \l__block_one_label_box { \linewidth }
1320     { \exp_after:wN \use_i:nn \l__block_item_align_tl

```

FMi: L^AT_EX 2_ε keeps the label boxed inside (not unboxed). This means that the content stays rigid and does not vary based on glue setting in the line with the label. There are cases where we do want the unboxed version (I think enumitem offers that in some cases too) but it should probably not be the default.

```

1321 %   TODO: customize?
1322 %   \hbox_unpack_drop:N \l__block_one_label_box
1323   \box_use_drop:N \l__block_one_label_box

1324   \exp_after:wN \use_ii:nn \l__block_item_align_tl
1325   }
1326 }

```

Add another box level to the label box:

```

1327   \hbox_set:Nn \l__block_one_label_box
1328     { \box_use_drop:N \l__block_one_label_box }
1329 }
1330 \dim_compare:nNnTF { \box_wd:N \l__block_one_label_box } > \linewidth
1331 { \bool_set_true:N \l__block_long_label_bool }
1332 { \bool_set_false:N \l__block_long_label_bool }
1333 \hbox_gset:Nn \g__block_labels_box
1334 { \hbox_unpack_drop:N \g__block_labels_box
1335   \skip_horizontal:n { \itemindent - \labelsep - \linewidth }
1336   \hbox_unpack_drop:N \l__block_one_label_box
1337   \skip_horizontal:n { \labelsep }
1338   \bool_if:NT \l__block_next_line_bool
1339   { \bool_if:NT \l__block_long_label_bool { \nobreak \hfil \break } }
1340   % version of \newline inside an hbox that will be unpacked
1341 }
1342 % TODO??? FMi what's that?
1343 % \skip_set_eq:NN \parsep \l__block_item_parsep_skip

```

The next setting is for compatibility: The list template sets `\listparindent` to zero and otherwise doesn't use it any more. However, in the second argument of a legacy `list` environment the user may have set it explicitly to some other value and whatever value it

had was then used for `\parindent` within the list. Now we use its value only if it differs from zero but otherwise use whatever the template instances specify. This gives 99.9% compatibility for legacy documents. 100% for definitions using the `list` environment and a setting inside, but if the user used `\listparindent` within the document, e.g., inside a `verse` environment there there is one case in which the setting is ignored, i.e., when it was set back to zero. That's a rather unlikely scenario, but it is not impossible. However, I couldn't think of an approach that circumvents such boundary cases.

```
1344 \dim_compare:nNnF \listparindent = {0pt}
1345 { \dim_set_eq:NN \parindent \listparindent }
```

Placing the list label(s) is done when the paragraph for the `\item` is started, which executes `\__block_everypar:` inside `para/begin`. By default this command does nothing, now we change it to attach the pending label or labels.

```
1346 \__block_debug_typeout:n{Set~ item~ block~ everypar \on@line }
1347 \cs_set_eq:NN \__block_everypar: \__block_item_everypar_std:
1348 }
```

`g_block_label_standalone_bool` The two booleans for implementing label-placement and below caption-placement.

```
g_block_label_unchained_bool 1349 \bool_new:N \g_block_label_standalone_bool % tmp until replaced
1350 \bool_new:N \g_block_label_unchained_bool % tmp until replaced
```

(End of definition for `g_block_label_standalone_bool` and `g_block_label_unchained_bool`.)

`\l_block_item_align_tl`

```
1351 \tl_new:N \l_block_item_align_tl
```

(End of definition for `\l_block_item_align_tl`.)

`\l_block_one_label_box`
`\g_block_labels_box`

Each label is typeset in `\l_block_one_label_box` to be measured. Once this is ready, it is put (boxed or unboxed) in `\g_block_labels_box`, together with any pending labels (for the case where a list begins just after `\item`). This is an analogue of L^AT_EX 2_ε's `\@labels`, but it is always unboxed before use, to support both boxed and unboxed labels.

```
1352 \box_new:N \l_block_one_label_box
1353 \box_new:N \g_block_labels_box
```

(End of definition for `\l_block_one_label_box` and `\g_block_labels_box`.)

`\l_block_long_label_bool`

Track whether the `\l_block_one_label_box` is larger than `\labelwidth`.

```
1354 \bool_new:N \l_block_long_label_bool
```

(End of definition for `\l_block_long_label_bool`.)

`\__block_make_label_box:n`
`\__block_label_format:e`

Make one label, wrapped in `\__block_label_format:n`, with an appropriate `\strut` and possibly `\makeatlabel` in compatibility mode (used for the `list` environment).

```
1355 \cs_new_protected:Npn \__block_make_label_box:n #1
1356 { \hbox_set:Nn \l_block_one_label_box
```

If we do tagging then the contents of this box may need to be wrapped into a structure, e.g., <Lbl>.

```

1357     { \tag_socket_use:nnn {block/list/label}}{}
1358     { \_block_label_format:n
1359       { \bool_if:NT \l_block_label_strut_bool { \strut }
1360         \bool_if:NTF \l_block_legacy_support_bool
1361           \makelabel
1362           \use:n
1363           {#1}
1364       }

```

And what gets opened also needs closing:

```

1365     }
1366   }
1367 }

```

(End of definition for _block_make_label_box:n and _block_label_format:e.)

block/list/label (socket) A tagging socket to tag the label. It takes two arguments so that it can transparently pass the label content. Declaration is in `ltagging.dtx`.
I think this socket should just be called list/label
default (plug)

```

1368 \NewTaggingSocketPlug{block/list/label}{default}
1369 {
1370   %
1371   % FMi: this needs a different logic to decide when to make the label
1372   %   an artifact (after cleaning up the \item code ), therefore
1373   %   disabled for now
1374   % \tl_if_empty:oTF \@itemlabel
1375   % {
1376   %   \tag_mc_begin:n {artifact}
1377   % }
1378   % {
1379   \tagstructbegin{tag=\UseStructureName{block/list/label}}
1380   \tagmcbegin{tag=\UseStructureName{block/list/label}}
1381   % }
1382   #2
1383   \tagmcend % end mc-\UseStructureName{block/list/label} or artifact
1384   % FMi: unconditionally for now
1385   % \tl_if_empty:oF \@itemlabel
1386   \tagstructend % end label
1387   \tagstructbegin{tag=\UseStructureName{block/list/body}}
1388 }
1389 \AssignTaggingSocketPlug{block/list/label}{default}

```

_block_everypar: The _block_everypar: command is executed as part of para/begin but most of the time does nothing, i.e., it has the following default definition outside of lists (and most of the time within lists).
_block_item_everypar_std:
_block_item_everypar_first:

```

1390 \cs_new_eq:NN \_block_everypar: \prg_do_nothing:
1391 \AddToHook{para/begin}[items]{\_block_everypar:}

```

Note that we have to make sure that the above code is executed after the hook chunk from `tagpdf` because the latter uses `@inlabel` to make a decision.

By the end of the day both should probably move into the kernel hook instead.

```
1392 \DeclareHookRule{para/begin}{items}{after}{tagpdf}
```

What follows is the version that resets various legacy booleans and puts the label box in the right place and finally resets itself to do nothing next time. `\__block_everypar:` is set to this by the item template so that the next paragraph start runs the code below.

```
1393 \cs_new_protected:Npn \__block_item_everypar_std: {
1394   \__block_debug_typeout:n{...~ in~ item~ block~ everypar \on@line }
1395   \legacy_if_set_false:n { @minipage }
1396   \legacy_if_gset_false:n { @newlist }
1397   \legacy_if:nT { @inlabel }
1398   { \legacy_if_gset_false:n { @inlabel }

1399   \box_if_empty:NT \g_para_indent_box { \kern - \itemindent }
1400   \para_omit_indent:
```

TODO: that boxing/unboxing need to be reevaluated at some point

```
1401   \bool_if:NTF \l__block_next_line_bool
1402   { \hbox_unpack_drop:N \g__block_labels_box }
1403   { \box_use_drop:N \g__block_labels_box }
```

After the labels are placed we start a paragraph structure (if appropriate). This is handled in the following kernel hook:

```
1404   \__kernel_list_label_after:n {LI-}

1405   \penalty \c_zero_int
1406   }
1407   \legacy_if:nTF { @nobreak }
1408   { \legacy_if_gset_false:n { @nobreak }
1409     \int_set:Nn \clubpenalty { 10000 }
1410   }
1411   { \int_set_eq:NN \clubpenalty \@clubpenalty
```

Once the label(s) are typeset and we are past any special `@nobreak` handling we reset `\__block_everypar:` to do nothing.

```
1412   \__block_debug_typeout:n{Set~ noop~ block~ everypar \on@line }
1413   \cs_set_eq:NN \__block_everypar: \prg_do_nothing:
1414   }
1415 }
```

This is the definition of `\__block_everypar:` before the first `\item` is encountered.

```
1416 \cs_new_protected:Npn \__block_item_everypar_first: {
1417   \__block_debug_typeout:n{...~ in~ first~ block~ everypar \on@line }
1418   \legacy_if:nT { @newlist } { \@noitemerr }
1419 }
```

(End of definition for `\__block_everypar:`, `\__block_item_everypar_std:`, and `\__block_item_everypar_first:`.)

`\l__block_tmpa_skip` A temporary skip for this module.

```
1420 \skip_new:N \l__block_tmpa_skip
```

(End of definition for `\l__block_tmpa_skip`.)

`\l_block_effective_top_skip` Variables equivalent to L^AT_EX 2_ε's `\@topsepadd` and `\@topsep`. Roughly equal to a mixture of `topsep`, `partopsep`, and various `parskip` at different nesting levels in lists. The code is really elaborate when `@inlabel` is true.

```
1421 \skip_new:N \l_block_effective_top_skip
```

```
1422 \skip_new:N \l_block_effective_bot_skip
```

(End of definition for `\l_block_effective_top_skip` and `\l_block_effective_bot_skip`.)

`item/before` (hook)

`item/after` (hook) We provide hooks at the begin and the end of an item. The before hook is just after the tagging code opens the LI structure (if tagging is active). The after hook is just before the tagging code closes the LI structure. The hooks are executed in vmode. In the item/before hook no typesetting should be done. It is possible to add content in the item/after but for correct tagging it must be wrapped in an `<LBody>` structure (e.g., with `tag=\UseStructureName{block/list/body}`).

```
1423 \NewHook{item/before}
```

```
1424 \NewHook{item/after}
```

\item Here we already have all the building blocks. Complain in math mode. Distinguish between first item (do necessary tagging) and later items `\_block_inter_item`: to cleanly close what's before, then call `\_block_item_instance:n` (which calls `\UseInstance{item}{\langle instance \rangle}`) to prepare the upcoming item: it will be actually inserted only once some later material triggers `\everypar`.

```
1425 \AddToHook{begindocument/before}[./legacy-lists]{
```

```
1426   \RenewDocumentCommand{\item}{\={label}o }{
```

```
1427     {
```

```
1428       \@inmatherr \item
```

TODO: Check if test for being outside of a list is sensible

```
1429       \cs_if_free:NTF \_block_item_instance:n
```

```
1430       {
```

```
1431         \@latex@error{Lonely~\string\item--perhaps-a-missing~
```

```
1432         list~environment}\@ehc
```

```
1433       }
```

```
1434     }
```

If the previous `\item` ended in an environment requesting `@endpe` handling we have to ensure that a `\par` is seen so that the semantic paragraph surrounding that environment ends (as it can't extend to the next item).

```
1435       \if@endpe \par \fi
```

```
1436       \legacy_if:NTF { @newlist }
```

```
1437       {
```

```
1438         \_kernel_list_item_begin:
```

```
1439         \hook_use:n{item/before}
```

The first item of a list also has to change the `@newlist` switch.

```
1440       \legacy_if_gset_false:n { @newlist }
```

```
1441     }
```

```
1442     { \_block_inter_item: }
```

To avoid unnecessary key/val processing we make a quick check if there was an optional argument.

```
1443      \tl_if_novalue:nTF {#1}          % avoids reparsing label={}
1444      { \__block_item_instance:n { } }
```

If there was an optional argument but it was empty we interpret it as a request to use an empty label and not as an empty key/val list.

```
1445      { \tl_if_blank:nTF {#1}
1446        { \__block_item_instance:n { label={} } }
1447        { \__block_item_instance:n {#1} }
1448      }
```

The `item` instance puts the item label into `\g__block_label_standalone_bool` ready to be placed later. To make that happen we need to signal that by setting the legacy switch `@inlabel` to true. However, if this is a label that should be always placed “standalone” we instead typeset it immediately and ensure that there is no page break after it.

support extra vertical space as well?

```
1449      \bool_if:NTF \g__block_label_standalone_bool
1450      {
1451        \bool_gset_false:N \g__block_label_standalone_bool
1452        \leavevmode
1453        \box_use_drop:N \g__block_labels_box
1454        \par
1455        \legacy_if_gset_true:n { @nobreak } % do not break after
1456                                           % a standalone item
1457      }
1458      {
1459        \legacy_if_gset_true:n { @inlabel }
1460      }
1461      \ignorespaces
1462    }
1463  }
1464 }
```

(End of definition for `\item`. This function is documented on page 40.)

`\__block_inter_item:` Between items. If the previous item had no content then we need to trigger `\everypar`. Otherwise we simply close the previous item with `\par` after removing some horizontal space. Between items, there is a penalty and some space.

```
1465 \cs_new_protected:Npn \__block_inter_item: {
1466   \legacy_if:nT { @inlabel }
1467   { \indent \par } % case of \item\item
```

`\par` may have a strange definition and may not get us back to vertical mode in one go, so we better not treat the next line as an else case to the above conditional (for now).

```
1468   \mode_if_horizontal:T { \__block_skip_remove_last:
1469     \__block_skip_remove_last: \par }
```

End any LI-tag, then start the next LI-tag (if doing tagging):

```
1470   \hook_use:n{item/after}
1471   \__kernel_list_item_end:
1472   \__kernel_list_item_begin:
1473   \hook_use:n{item/before}
```

```

1474 \addpenalty \@itempenalty
1475 \addvspace \itemsep
1476 }
(End of definition for \_block\_inter\_item:.)

```

```

\_kernel\_list\_item\_begin:
\_kernel\_list\_item\_end:
1477 \cs\_new\_eq:NN \_kernel\_list\_item\_begin: \prg\_do\_nothing:
1478 \cs\_new\_eq:NN \_kernel\_list\_item\_end: \prg\_do\_nothing:
(End of definition for \_kernel\_list\_item\_begin: and \_kernel\_list\_item\_end:.)

```

9.3.7 Implementation of captionedtext and thmstyle templates

`captionedtext thmlike` (*templ.*) The template for typical theorem-like environments is fairly trivial: just setting keys, making an appropriate link target, and then passing used keys and the arguments to a `thmstyle` instance to do the rest of the work.

```

1479 \DeclareTemplateCode{captionedtext}{thmlike}{4}{
1480   ,numbered      = \l\_block\_numbered\_bool
1481   ,counter       = \l\_block\_counter\_tl
1482   ,number       = \l\_block\_number\_tl
1483   ,title        = \l\_block\_title\_tl
1484   ,note         = \l\_block\_note\_tl
1485   ,style        = \_block\_style:nnnn
1486 }
1487 {

```

Some debugging info as usual (showing the arguments that are passed):

```

1488 \template\_debug\_typeout:n{~\space template:~ 'thmlike';~
1489                               arguments:~ \exp\_not:o{\exp\_after:wN |#1|#2|#3|#4|}}

```

Then we check if there are any keys passed to the instance from the outside.

```

1490 \SetKnownTemplateKeys{captionedtext}{thmlike}{#1}

```

Determine if we do automatic numbering: If there was a star (so #2 is `\BooleanTrue`) or no counter was specified, set `\l\_block\_numbered\_bool` to `false` (it is `true` by default), but may have been set to `false` via the key `numbered`).

```

1491 \bool\_lazy\_or:nnT
1492 { \tl\_if\_empty\_p:N \l\_block\_counter\_tl }
1493 { #2 }
1494 { \bool\_set\_false:N \l\_block\_numbered\_bool }

```

The check what we have: if we are numbering things, we check if the key `number` got a value. If not we set it to `\the<counter>` and make a link target using the counter name.

```

1495 \bool\_if:N\TF \l\_block\_numbered\_bool
1496 { \exp\_args:No \tl\_if\_novalue:nTF \l\_block\_number\_tl
1497   { \tl\_set:Nn \l\_block\_number\_tl
1498     { \use:c{ the \l\_block\_counter\_tl } }
1499     \@kernel@refstepcounter{ \l\_block\_counter\_tl }
1500     \MakeLinkTarget{ \l\_block\_counter\_tl }
1501   }

```

Otherwise we make a link target with some internal unique name.

```

1502   { \MakeLinkTarget[theorem-like]{} }
1503 }

```

If we aren't doing numbering we force the value of the `number` key to `\NoValue` so that nothing is typeset even if it had a value for some reason.

```

1504     { \tl_set:Nn \l__block_number_tl \NoValue
1505       \MakeLinkTarget[theorem-like]{}
1506     }

```

Save any note for later use. If the key `note` and the mandatory argument both have values then the argument from the document wins.

```

1507     \IfValueT{#3} { \tl_set:Nn \l__block_note_tl {#3} }

```

We set `\@currentlabelname` to the current note or to empty.

```

1508     \tl_if_novalue:oTF \l__block_note_tl
1509     {} %TODO: decide if some other value makes sense
1510     {\tl_set_eq:NN\@currentlabelname\l__block_note_tl}

```

Finally, we apply the style which is just an instance of type `thmstyle`:

```

1511     \__block_style:nnnn \UnusedTemplateKeys {#2} {#3} {#4}
1512 }

```

`\theoremstyle` All that the `\theoremstyle` declaration does is saving its argument so that it can be used in `\newtheorem`.

```

1513 \cs_new_protected:Npn \theoremstyle #1{ \tl_set:Nn \l__block_thmstyle_tl {#1} }
1514 \tl_new:N \l__block_thmstyle_tl

```

And the default is `plain`:

```

1515 \theoremstyle{plain}

```

(End of definition for `\theoremstyle` and `\l__block_thmstyle_tl`. This function is documented on page ??.)

`thmstyle std (templ.)` The `thmstyle` implements the theorem-like environment and assumes that the fixed part of the caption is already stored in `\l__block_title_tl`. The reason for this separation into two templates is that typically the same design is used for different theorem-like environments only differing in this fixed string.

It also assumes that `\l__block_number_tl` holds the number value (if numbering is done) and that in `\l__block_note_tl` any note is stored. Both token lists might be `\NoValue`.

```

1516 \DeclareTemplateCode{thmstyle}{std}{4}
1517 {
1518   ,separator      = \l__block_separator_tl           % compatibility
1519   ,separator-a    = name {l__block_separator-a_tl}
1520   ,separator-b    = name {l__block_separator-b_tl}
1521   ,punct          = \l__block_punct_tl
1522   ,caption-placement = {
1523     chained       = \bool_gset_false:N \g__block_label_standalone_bool
1524                   \bool_gset_false:N \g__block_label_unchained_bool
1525     ,unchained    = \bool_gset_false:N \g__block_label_standalone_bool
1526                   \bool_gset_true:N \g__block_label_unchained_bool
1527     ,standalone   = \bool_gset_true:N \g__block_label_standalone_bool
1528                   \bool_gset_false:N \g__block_label_unchained_bool
1529   }
1530   ,caption-unbreakable = \l__block_caption_unbreakable_bool
1531   ,before-hspace    = \l__block_caption_before_skip

```

```

1532 ,after-hspace = \l__block_caption_after_skip
1533 ,order        = \l__block_order_clist
1534 ,caption-decls = \l__block_caption_decls_tl
1535 ,title-decls   = \l__block_title_decls_tl
1536 ,number-tag    = \l__block_number_tag_tl
1537 ,number-decls  = \l__block_number_decls_tl
1538 ,punct-decls   = \l__block_punct_decls_tl
1539 ,note-decls    = \l__block_note_decls_tl
1540 ,title-format  = \__block_title_format:n
1541 ,number-format = \__block_number_format:n
1542 ,punct-format  = \__block_punct_format:n
1543 ,note-format   = \__block_note_format:n
1544 ,body-decls    = \l__block_body_decls_tl
1545 }
1546 {

```

Some tracing:

```

1547 \template_debug_typeout:n{~\space template:~ 'std';~
1548                                arguments:~ \exp_not:o{\exp_after:wN |#1|#2|#3|#4|}}

```

Applying any user keys:

```

1549 \SetKnownTemplateKeys{thmstyle}{std}{#1}

```

Since this is the last template that gets applied for theorem-like environments, all keys should make sense, so if something is left over we better generate an error:

```

1550 \tl_if_empty:NF \UnusedTemplateKeys
1551   { \msg_error:nneo { block } { unknown-keys }
1552     { \l__block_env_name_tl \space environment}
1553     \UnusedTemplateKeys
1554   }

```

Add the caption into `\g__block_labels_box`:

```

1555 \hbox_gset:Nn \g__block_labels_box
1556   { \box_use_drop:N \g__block_labels_box % <- does nothing if
1557                                             % there is no dangling label

```

Now apply the declarations that are for the whole caption.

```

1558 \l__block_caption_decls_tl

```

Then we apply the tagging socket for the caption to the complete content:

```

1559 \tag_socket_use:nnn {captionedtext/caption} {}
1560   { \skip_horizontal:n { \l__block_caption_before_skip }

```

For flexibility, the inner structure is given as a clist stored in `\l__block_order_clist`. We loop through it and call a processing function for each item in this clist. Everything happens in a group. This is done by using the general order key functionality from the template module.

```

1561 \template_process_order_clist:nnn
1562   { block }{ order }
1563   { note, number, punct, separator,
1564     separator-a, separator-b, title }
1565   \skip_horizontal:n { \l__block_caption_after_skip }
1566 }
1567 }

```

If the title should be standalone we immediately push it out:

```

1568 \bool_if:NTF \g__block_label_standalone_bool
1569 { \bool_gset_true:N \g__block_label_standalone_bool
1570   \para_omit_indent:
1571   \box_use_drop:N \g__block_labels_box
1572   \par
1573 }

```

Do we need a `\nobreak` here or is this covered? check

Otherwise we signal that we are at the start and have a label dangling. The name `@newlist` is a bit unfortunate, but for now we keep this name.

```

1574 { \legacy_if_gset_true:n { @newlist }
1575   \legacy_if_gset_true:n { @inlabel }
1576 }

```

check if `@newlist` could be replaced by something more general

Do not break after the first line:

```

1577 \legacy_if_gset_true:n { @nobreak }

```

Then set up a special `everypar` to handle the dangling caption. This `everypar` also issues `\l_block_body_decls_tl` as part of its processing. This has to be delayed until then, because otherwise, something such as a color setting would apply also to the caption in its box.

```

1578 \__block_debug_typeout:n{Set~ captioned~ block~ everypar \on@line }
1579 \cs_set_eq:NN \__block_everypar: \__block_captioned_everypar_std:

```

Finally, set up any declarations for the body of the environment:

```

1580 % \l_block_body_decls_tl
1581 \__block_debug_typeout:n{template:thmstyle:std~end}
1582 }

```

Not really sure it is good idea to error; other parts of instance declarations also fail on incorrect data without any checks so why this one? TODO decide.

```

1583 \msg_new:nnnn { block } { unknown-key-value }
1584 { The~ value~ '#2'~ in~ key~ '#1'~ is~ not~ recognized. }
1585 { Perhaps~ a~ misspelling~ or~ the~ current~ template~
1586   instance~ uses~ special~ values.
1587 }

```

/captionedtext/caption (socket)

```

1588 \NewTaggingSocket{captionedtext/caption}{2}

```

why kernel?

```

1589 \NewTaggingSocketPlug{captionedtext/caption}{kernel}
1590 { \tag_struct_begin:n{tag=\UseStructureName{block/theorem-like/caption}}
1591   #2
1592   \tag_struct_end:
1593 }
1594 \AssignTaggingSocketPlug{captionedtext/caption}{kernel}

```

Here are the functions that are called when the corresponding name appears in the caption clist.

`captionedtext proof (templ.)` In case of the templates for proofs we do everything in a single template.

```

1595 \DeclareTemplateCode{captionedtext}{proof}{4}{
1596   title           = \l__block_title_tl
1597   ,note           = \l__block_note_tl
1598   ,punct          = \l__block_punct_tl
1599   ,separator      = \l__block_separator_tl
1600   ,order          = \l__block_order_clist
1601   ,caption-placement = {
1602     chained       = \bool_gset_false:N \g__block_label_standalone_bool
1603                   \bool_gset_false:N \g__block_label_unchained_bool
1604     ,unchained    = \bool_gset_false:N \g__block_label_standalone_bool
1605                   \bool_gset_true:N \g__block_label_unchained_bool
1606     ,standalone   = \bool_gset_true:N \g__block_label_standalone_bool
1607                   \bool_gset_false:N \g__block_label_unchained_bool
1608   }
1609   ,caption-unbreakable = \l__block_caption_unbreakable_bool
1610   ,before-hspace = \l__block_caption_before_skip
1611   ,after-hspace  = \l__block_caption_after_skip
1612   ,caption-decls = \l__block_caption_decls_tl
1613   ,title-decls   = \l__block_title_decls_tl
1614   ,note-decls    = \l__block_note_decls_tl
1615   ,punct-decls   = \l__block_punct_decls_tl
1616   ,title-format  = \__block_title_format:n
1617   ,note-format   = \__block_note_format:n
1618   ,punct-format  = \__block_punct_format:n
1619   ,body-decls    = \l__block_body_decls_tl
1620 }

```

Display the template's arguments when tracing:

```

1621 { \template_debug_typeout:n{~\space template:~ 'proof';~
1622                                     arguments:~ \exp_not:o{\exp_after:wN |#1|#2|#3|#4|}}

```

Evaluate document-level key settings. As all given keys should be handled we use `\SetTemplateKeys` to raise an error if one or more are not recognized:

```

1623 \SetTemplateKeys{captionedtext}{proof}{#1}

```

By default the title is defined by the proof instance, but if the user provides an optional argument that optional argument overwrites the title (in contrast to theorem-like environments that use the optional argument to provide an additional note):

```

1624 \IfNoValueF {#3} { \tl_set:Nn \l__block_title_tl {#3} }

```

We set `\@currentlabelname` to the current note value.

```

1625 \tl_if_novalue:oTF \l__block_note_tl
1626 {} % TODO: decide later which value should be used
1627 {\tl_set_eq:NN \@currentlabelname \l__block_note_tl}

```

Now we prepare typesetting the title by placing it in the `\g__block_labels_box`:

```

1628 \hbox_gset:Nn \g__block_labels_box
1629 { \box_use_drop:N \g__block_labels_box % <- does nothing if there
1630                                     % is no dangling label
1631   \l__block_caption_decls_tl
1632   \tag_socket_use:nnn {captionedtext/caption} {}
1633   { \skip_horizontal:n { \l__block_caption_before_skip }

```

Process the `order` key. As we have only two text parts a single `separator` should be enough. Note that one can have notes with this design, but in the document it can only be specified via `note=...`

```

1634         \template_process_order_clist:nnn
1635         { block }{ order }
1636         { note, punct, title, separator }
1637         \skip_horizontal:n { \l_block_caption_after_skip }
1638     }
1639 }

```

The remaining code is identical to the one in `thmstyle std`; for documentation see there:

```

1640 \bool_if:NTF \g_block_label_standalone_bool
1641 { \bool_gset_true:N \g_block_label_standalone_bool
1642   \para_omit_indent:
1643   \bool_if:NTF \l_block_caption_unbreakable_bool
1644     \box_use_drop:N
1645     \hbox_unpack_drop:N
1646     \g_block_labels_box
1647   \par
1648 }
1649 { \legacy_if_gset_true:n { @newlist }
1650   \legacy_if_gset_true:n { @inlabel }
1651 }
1652 \legacy_if_gset_true:n { @nobreak }
1653 \__block_debug_typeout:n{Set~ captioned~ block~ everypar \on@line }
1654 \cs_set_eq:NN \__block_everypar: \__block_captioned_everypar_std:
1655 % \l_block_body_decls_tl

1656 \__block_debug_typeout:n{template:captionedtext:proof~end}
1657 }

```

9.4 Tagging support commands

In this section we provide code to the various kernel hooks to support the tagging of different displayblock environments.

`\__block_beginpar_vmode:` When a block starts out in vertical mode, i.e., is not yet part of a paragraph, we have to start a paragraph structure. However, this is not the case if we are already flattening paragraphs, thus in this case we do nothing. We also do nothing if `@endpe` is currently true, because that means we are right now just after the end of a `blockenv` and in the process of looking if we have to end the current `<semantic-para>`, i.e., it is already open. The command is mapped to `\__kernel_displayblock_beginpar_vmode:` in various tagging recipes. It is also used in the math code!

```

1658 \cs_set:Npn \__block_beginpar_vmode: {
1659   \__block_debug_typeout:n
1660   { @endpe = \legacy_if:NTF { @endpe }{true}{false} \on@line }
1661   \legacy_if:NTF { @endpe }
1662   {
1663     \legacy_if_gset_false:n { @endpe }
1664   }

```

We test for <2 because the first flattened environment has to surround itself with a <semantic-para>. Only any inner ones then have to avoid adding another <semantic-para>.

```

1665 {
1666   \int_compare:nNtT \l__tag_block_flattened_level_int < 2
1667   {
1668     \typeout{===> __block_beginpar_vmode:}
1669     \ShowTagging{struct-stack}
1670     \UseTaggingSocket{para/semantic/begin}
1671     { }
1672     \ShowTagging{struct-stack}
1673   }
1674 }
1675 }

```

(End of definition for __block_beginpar_vmode:.)

__block_beginpar_hmode:N If the block is already part of a part of a paragraph, i.e., when it has some text directly in front, then the first thing to do is to return to vertical mode. However, that should be done without inserting a paragraph end tag, so before calling \par to do its normal work, we disable paragraph tagging and restarting afterwards again. The argument to this config point simply gobbles the \par following it in the code above (which is used when there is no tagging going on).

The command is mapped to __kernel_displayblock_beginpar_hmode:w in various tagging recipes.

```

1676 \cs_set:Npn \__block_beginpar_hmode:N #1
1677 {
1678   \UseTaggingSocket{para/textblock/end}
1679   \tagpdfparaOff \par \tagpdfparaOn
1680 }

```

(End of definition for __block_beginpar_hmode:N.)

Paragraph tagging is mainly done using the paragraph hooks. The code is in lttagging.dtx.

\block/startpara/direct (socket) A tagging socket to start a paragraph structure. It takes an argument (which is only used in debugging) that should be gobbled if tagging is not active. Not yet in lttagging (name and function should be reviewed).

This is a similar code to the one used in the para/begin hook but without testing @endpe. This is not needed in the standalone case and wrong inside lists.

This code is used in various places and should be a dummy if tagging is not active.

```

1681 \socket_if_exist:nF {taggsupport/block/startpara/direct}
1682 {
1683   \NewTaggingSocket {block/startpara/direct}{1}
1684 }

```

default (plug)

```

1685 \NewTaggingSocketPlug{block/startpara/direct}{default}
1686 {
1687   \bool_if:NT \l__tag_para_bool
1688   {
1689     \bool_if:NF \l__tag_para_flattened_bool
1690     {

```

```

1691 %           \typeout{==> block/startpara/direct}
1692 %           \ShowTagging{struct-stack}
1693           \UseTaggingSocket{para/semantic/begin}
1694             { }
1695         }
1696     \UseTaggingSocket{para/textblock/begin} { #1 }
1697 }
1698 }
1699 \AssignTaggingSocketPlug{block/startpara/direct}{default}

```

The para/end hook code is in lttagging. Currently we still need to remove the tagpdf chunk to avoid that the socket is added twice. We add empty chunks to avoid warning messages from code parts trying to remove the chunks.

```

1700 \AddToHook{para/end}[tagpdf]{}
1701 \RemoveFromHook{para/end}[tagpdf]
1702 \AddToHook{para/end}{}

1703 \def\PARALABEL{NP-}

```

port/kernel/endpe/vmode (socket) A tagging socket which ends a structure. Used in \begin and \para_end:. Not yet in lttagging (name and function should be reviewed).

```

1704 \socket_if_exist:nF {taggsupport/kernel/endpe/vmode}
1705 {
1706     \NewTaggingSocket {kernel/endpe/vmode}{0}
1707 }

```

default (plug)

```

1708 \NewTaggingSocketPlug{kernel/endpe/vmode}{default}
1709 {
1710     \if@endpe \ifvmode
1711         \bool_if:NT \l__tag_para_bool
1712         {
1713             \bool_if:NF \l__tag_para_flattened_bool
1714             {
1715                 \UseTaggingSocket{para/semantic/end}{}
1716             }
1717         }
1718     }
1719 }

```

\@endpefalse is needed by \para_end:, see test tagging-0097.

```

1717     \@endpefalse
1718 }
1719 \fi \fi
1720 }
1721 \AssignTaggingSocketPlug{kernel/endpe/vmode}{default}

```

\para_end: If we see a \par in vmode and a <semantic-para> is still open we need to close that. For this we check if a request for @endpe was made (but the \par redefinition got lost due to (bad?) coding).

```

1722 \cs_set_protected:Npn \para_end: {
1723     \scan_stop:
1724     \mode_if_horizontal:TF {
1725         \mode_if_inner:F {
1726             \tex_unskip:D

```

```

1727     \hook_use:n{para/end}
1728     \@kernel@after@para@end
1729     \mode_if_horizontal:TF {
1730         \if_int_compare:w 11 = \tex_lastnodetype:D
1731             \tex_hskip:D \c_zero_dim
1732         \fi:
1733         \tex_par:D
1734         \hook_use:n{para/after}
1735         \@kernel@after@para@after
1736     }
1737     { \msg_error:nnnn { hooks }{ para-mode }{end}{horizontal} }
1738 }
1739 }
1740 {

```

TODO 2025-07-01. This is not exactly as before, this doesn't insert an `\endpfalse` when tagging is active. Check if this a problem.

```

1741     \UseTaggingSocket{kernel/endpe/vmode}%
1742     \tex_par:D
1743 }
1744 }

```

Now reset $\text{\LaTeX 2}_\varepsilon$ functions to use the changed `\para_end`: [TODO: Need to check if `\@@par` is ever used in a way that the `vmodetagging` hook is needed.]

```

1745 \cs_set_eq:NN \par      \para_end:
1746 \cs_set_eq:NN \@@par \para_end:
1747 \cs_set_eq:NN \endgraf \para_end:

```

(End of definition for `\para_end`:. This function is documented on page 41.)

\begin We need to do a little more than canceling `@endpe` now.

```

1748 \protected\def\begin#1{%
1749     \UseHook{env/#1/before}%
1750     \@ifundefined{#1}%
1751         {\def\reserved@a{\@latex@error{Environment~#1~undefined}\@eha}}%
1752         {\def\reserved@a{\def\@currentvir{#1}%
1753             \edef\@currentvline{\on@line}%
1754             \@execute@begin@hook{#1}%
1755             \csname #1\endcsname}}%
1756     \@ignorefalse
1757     \begingroup

```

The original $\text{\LaTeX 2}_\varepsilon$ version did set `\@endpfalse` unconditionally at this point, but this is conceptually wrong because it prevents the upcoming environment from seeing if `@endpe` handling was requested, which matters if tagging is done. Instead, resetting `@endpe` should only happen at the start of block environments after they have evaluate the current status of this flag. For the same reason it is not correct to unconditionally end a semantic paragraph here, because `@endpe` is `true` we are in a semantic paragraph that should continue.

```

1758 %     \@endpfalse
1759     \reserved@a}

```

(End of definition for `\begin`. This function is documented on page 40.)

`\__kernel_list_label_after:n` If starting the semantic-para and text-block tags got delayed because of a pending label we have to do it after the label got typeset. TODO: it should do nothing without tagging that's why there is a test, this should be better hidden in a tagging socket, but it is not quite clear how to do this.

internally this is now a tagging socket, why the outer test then?

```
1760 \cs_new_protected:Npn \__kernel_list_label_after:n #1 {
1761   \tag_socket_use:nn {block/startpara/direct} { #1 }
1762 }
```

(End of definition for __kernel_list_label_after:n.)

`\__block_inner_begin:` Start a block that has an inner structure if it isn't also a list. This command is tagging specific, it is mapped to `\__kernel_displayblock_begin:` in some tagging recipes.

```
1766 \cs_new_protected:Npn \__block_inner_begin: {
1767   \tag_structbegin{tag=\l__block_tag_inner_tag_tl}
1768 }
```

(End of definition for __block_inner_begin:.)

`\__block_inner_end:` End a block (which isn't also a list). This command is tagging specific, it is mapped to `\__kernel_displayblock_end:` in some tagging recipes.

```
1769 \cs_new_protected:Npn \__block_inner_end: {
1770   \__block_debug_typeout:n{block-end \on@line}
```

If there is an open request for `@endpe` handling still open (from material in the environment body) then a semantic para is still open and we have to close it before closing the inner structure.

```
1771   \legacy_if:nT { @endpe }
1772   {
1773     \UseTaggingSocket{para/semantic/end}
1774     { \__block_debug_typeout:n{close~ /semantic-para \on@line}}
1775   }
1776   \tag_structend % end inner structure
1777 }
```

(End of definition for __block_inner_end:.)

9.4.1 List tags

```
1778 \tl_new:N \l__tag_L_tag_tl
1779 \tl_set:Nn \l__tag_L_tag_tl {\UseStructureName{block/list}}
```

`\l__tag_L_attr_class_tl` The variable should be set to one of the list attributes `list`, `itemize` `enumerate` or `description` declared in `latex-lab-namespaces`.

```
1780 \tl_new:N \l__tag_L_attr_class_tl
1781 \tl_set:Nn \l__tag_L_attr_class_tl {list}
```

(End of definition for \l__tag_L_attr_class_tl.)

`\__block_list_begin:` Start a list ... This command is tagging specific, it is mapped to `\__kernel_displayblock_begin:` in a tagging recipe.

```
1782 \cs_set:Npn \__block_list_begin: {
1783   \tag_structbegin
1784   {
1785     tag=\l__tag_L_tag_tl
1786     ,attribute-class=\l__tag_L_attr_class_tl
1787   }
1788 }
```

(End of definition for `\_block\_list\_begin:`)

`\_block\_list\_item\_begin:` Start tagging a list item. This command is tagging specific, it is mapped to `\_kernel\_list\_item\_begin:` in a tagging recipe.

```
1786 \cs_set:Npn \_block\_list\_item\_begin: {
1787   \tagstructbegin{tag=\UseStructureName{block/list/item}}
1788 }
```

(End of definition for `\_block\_list\_item\_begin:`)

`\_block\_list\_item\_end:` When a list item ends we have to close `<itembody>` and `<LI>` but also a `<text-block>` in the special case that the item material ends in a list (identifiable via `@endpe`). This command is tagging specific. This command is copied to `\_kernel\_list\_item\_end:` in the list recipe.

```
1789 \cs_set:Npn \_block\_list\_item\_end: {
1790   \legacy_if:nT { @endpe }
1791   {
1792     \UseTaggingSocket{para/semantic/end}
1793     { \_block\_debug\_typeout:n{Structure-end~ P~ at~ item-end \on@line } }
1794   }
1795   \tagstructend \tagstructend % end \UseStructureName{block/list/body}, LI
1796 }
```

(End of definition for `\_block\_list\_item\_end:`)

`\_block\_list\_end:` Finally, at the list end we have to close the open `<itembody>`, `<LI>`, `<L>`, and possibly a `<text-block>` if the last item ends with a list. However, if the user forgot to add an `\item` then there will be no `<LI>` and `<itembody>` open, so we check for the status of `@newlist`. The corresponding no-item error was generated earlier outside the tagging code.

One could argue that it doesn't matter if the tagging is wrong after a `\@noitemerr` was issued. However, there is one case where it isn't an error: In the `thebibliography` environment (which is internally a list) it is often the case that documents start out with an empty environment, not containing any `\bibitems`. For that reason `\@noitemerr` is redefined inside that environment to only produce a warning; hence we have to produce correct tag structures in that case. This command is tagging specific. This command is copied to `\_kernel\_displayblock\_end:` in the list recipe.

```
1797 \cs_new_protected:Npn \_block\_list\_end: {
```

If `@newlist` is true (i.e., when we have an error or warning situation) there is not much to close.

```
1798   \legacy_if:nF { @newlist }
1799   {
1800     \legacy_if:nT { @endpe }
1801     {
1802       \UseTaggingSocket{para/semantic/end}
1803       { \_block\_debug\_typeout:n{Structure-end~ semantic-para~ at~ list-end \on@line } }
1804     }
1805     \tagstructend % end \UseStructureName{block/list/body},
1806     \hook_use:n{item/after}
1807     \tagstructend % LI
```

```

1808     }
1809     \tagstructend           % end L
1810 }

```

(End of definition for `\__block_list_end:`.)

End of tagging related declarations.

9.4.2 Tagging recipes

`\tagssupport/block/recipe` (*socket*) A tagging socket to call the tagging recipe. Declared in `ltagging`.

```

1811 \socket_if_exist:Nf {tagssupport/block/recipe}
1812 {
1813     \NewTaggingSocket{block/recipe}{1}
1814 }

```

`default` (*plug*)

```

1815 \NewTaggingSocketPlug{block/recipe}{default}
1816 {
1817     \use:c { __block_recipe_#1: }
1818 }
1819 \AssignTaggingSocketPlug{block/recipe}{default}

```

`\__block_recipe_noop:` The `noop` recipe does nothing and the tagging of the block is handled as if the content where inserted directly surrounded by `\par`. The recipe does not set the endpe switch. If the block ends, e.g., with a list its setting is passed forward and the following text is not indented unless there is an empty line. If the block ends with normal text, text after the block starts a new paragraph and so is indented. The recipe is meant for environments like `adjustwidth` which only change the layout and which can contain, e.g., sectioning commands.

UFI: This recipe needs more tests!

```

1820 \cs_new_protected:Npn \__block_recipe_noop:
1821 {
1822     \cs_set_eq:NN \__kernel_displayblock_beginpar_hmode:w
1823                                     \prg_do_nothing:
1824     \cs_set_eq:NN \__kernel_displayblock_beginpar_vmode:
1825                                     \prg_do_nothing:
1826     \let \__kernel_displayblock_begin: \prg_do_nothing:
1827     \let \__kernel_displayblock_end: \prg_do_nothing:
1828 }

```

(End of definition for `\__block_recipe_noop:`.)

`\__block_recipe_basic:` The `basic` recipe simply ensures that the block is inside a `<semantic-para>` structure and if necessary starts one. When the block ends and is followed by a blank line the `<semantic-para>` structure is closed too, otherwise it remains open and further text starts with just a `<text-block>` structure.

There is otherwise no inner structure so `\__kernel_displayblock_begin:` and `\__kernel_displayblock_end:` do nothing—blockenvs with inner structure use the `standard` or `list` recipe instead.

```

1829 \cs_new_protected:Npn \__block_recipe_basic: {
1830     \cs_set_eq:NN \__kernel_displayblock_beginpar_hmode:w
1831                                     \__block_beginpar_hmode:N
1832     \cs_set_eq:NN \__kernel_displayblock_beginpar_vmode:

```

```

1833                                     \_block\_beginpar\_vmode:
1834 \let \_kernel\_displayblock\_begin: \prg\_do\_nothing:
1835 \let \_kernel\_displayblock\_end: \prg\_do\_nothing:
1836 }

```

(End of definition for _block_recipe_basic:.)

_block_recipe_standalone:

The **standalone** recipe produces a block that ensures that a previous <semantic-para> ends and that after the block a new <semantic-para> starts.

```

1837 \cs\_new\_protected:Npn \_block\_recipe\_standalone: {
1838   \cs\_set\_eq:NN \_kernel\_displayblock\_beginpar\_hmode:w
1839                                     \prg\_do\_nothing:
1840   \cs\_set\_eq:NN \_kernel\_displayblock\_beginpar\_vmode:
1841                                     \prg\_do\_nothing:
1842   \cs\_set\_eq:NN \_kernel\_displayblock\_begin: \_block\_inner\_begin:
1843   \cs\_set\_eq:NN \_kernel\_displayblock\_end: \_block\_inner\_end:
1844   \tl\_if\_empty:NTF \l\_block\_tag\_name\_tl
1845     { \tl\_set:Nn \l\_block\_tag\_inner\_tag\_tl {Sect} }
1846     { \tl\_set\_eq:NN \l\_block\_tag\_inner\_tag\_tl \l\_block\_tag\_name\_tl }
1847 }

```

(End of definition for _block_recipe_standalone:.)

_block_recipe_standard: The **standard** recipe does the following:

- surround the block with a <semantic-para> structure if not already in a <semantic-para>. In the latter case end the MC and the <text-block> but leave the <semantic-para> open.

If we are producing flattened paragraphs, just close any <text-block> but do not open a <semantic-para>.

- Then open an new (inner) structure (by default <Div> but typically the one specified on the instance).
- At the end of the block close the inner structure (<Div> or explicit one) but leave the <semantic-para> open to be either continued or closed due to a following \par.

```

1848 \cs\_new\_protected:Npn \_block\_recipe\_standard:
1849 {
1850   \cs\_set\_eq:NN \_kernel\_displayblock\_beginpar\_hmode:w
1851                                     \_block\_beginpar\_hmode:N
1852   \cs\_set\_eq:NN \_kernel\_displayblock\_beginpar\_vmode:
1853                                     \_block\_beginpar\_vmode:
1854   \cs\_set\_eq:NN \_kernel\_displayblock\_begin: \_block\_inner\_begin:
1855   \cs\_set\_eq:NN \_kernel\_displayblock\_end: \_block\_inner\_end:
1856   \tl\_if\_empty:NTF \l\_block\_tag\_name\_tl
1857     { \tl\_set:Nn \l\_block\_tag\_inner\_tag\_tl {\UseStructureName{block/inner}} }
1858     { \tl\_set\_eq:NN \l\_block\_tag\_inner\_tag\_tl \l\_block\_tag\_name\_tl }
1859 }

```

(End of definition for _block_recipe_standard:.)

`\l_block_tag_inner_tag_tl` The tag name that is used if the block has an inner structure.

```
1860 \tl_new:N \l_block_tag_inner_tag_tl
(End of definition for \l_block_tag_inner_tag_tl.)
```

`\_block_recipe_list:` The list recipe does the following.

- It opens a `<semantic-para>`-structure or keeps the current one open (only closing the MC).
- It then starts a new structure role-mapped to L-structure and arranges for handling list items, e.g., Li, itemlabel and itembody structures.
- At the end it closes open list structures as needed but keeps the `<semantic-para>`-structure open to continue the paragraph after the list, if necessary.

```
1861 \cs_new_protected:Npn \_block_recipe_list:
1862 {
1863   \cs_set_eq:NN \_kernel_displayblock_beginpar_hmode:w
1864                                     \_block_beginpar_hmode:N
1865   \cs_set_eq:NN \_kernel_displayblock_beginpar_vmode:
1866                                     \_block_beginpar_vmode:
1867   \cs_set_eq:NN \_kernel_displayblock_begin: \_block_list_begin:
1868   \cs_set_eq:NN \_kernel_displayblock_end:   \_block_list_end:
```

The next two lines could be done globally, because they are only called if we do have `\items`, i.e., if we are in a list. It is therefore also not necessary to reset them in other recipes (right now—this may change if we get more templates (like inline lists)).

```
1869   \cs_set_eq:NN \_kernel_list_item_begin:   \_block_list_item_begin:
1870   \cs_set_eq:NN \_kernel_list_item_end:     \_block_list_item_end:
```

Handle the tag name and attribute classes using the key values from the current list instance.

```
1871   \tl_if_empty:NTF \l_block_tag_name_tl
1872     { \tl_set:Nc \l_tag_L_tag_tl {\UseStructureName{block/list}} }
1873     { \tl_set_eq:NN \l_tag_L_tag_tl \l_block_tag_name_tl }
1874   \tl_if_empty:NTF \l_block_tag_class_tl
1875     { \tl_set:Nc \l_tag_L_attr_class_tl {} }
1876     { \tl_set_eq:NN \l_tag_L_attr_class_tl \l_block_tag_class_tl }
1877 }
```

(End of definition for `\_block_recipe_list:`.)

```
1878 </package-start>
```

10 Support code for document-level block environments

10.1 Verbatim-like environments

10.1.1 Helper commands for `verbatim` and `verbatim*`

`\legacyverbatimsetup` This code is called as part of the `final-code` of the `blockenv` instance and sets up the special conventions needed for `verbatim` environments. We pass one argument to differentiate between visible and invisible spaces.

This code resembles the $\text{\LaTeX}2_{\epsilon}$ verbatim implementation with a slight twist: in $\text{\LaTeX}2_{\epsilon}$ each code line was a paragraph using `\leftskip=\@totalleftmargin`. This was possible because the whole environment was implemented as a trivlist. As this is no longer the case setting `\leftskip` would alter the layout of a surrounding list. So instead we need to make sure that the paragraph end is executed in a group so that any parshape setup is preserved.

```

1879 <*package-finish>

1880 <@@=>
1881 \def\legacyverbatimsetup #1 {%
1882   \language\l@nohyphenation
1883   \@tempswafalse
1884   \def\par{%
1885     \if@tempswa
1886       \leavevmode \null {\@@par}\penalty\interlinepenalty
1887     \else
1888       \@tempswatrue
1889       \ifhmode{\@@par}\penalty\interlinepenalty\fi
1890     \fi

```

might also need a hook
not just a socket

Do something at the very beginning of each verbatim line:

```

1891   \UseSocket{verbatim/startline}%
1892 }%
1893 \let\do\@makeother \dospecials
1894 \obeylines \verbatim@font \@noligs
1895 \everypar \expandafter{\the\everypar \unpenalty}%
1896 \frenchspacing
1897 \AssignStructureRole {para/textblock}%
1898   {\UseStructureName{block/verbatim/codeline}}%

```

Should next line be hidden
in a tagging socket?

If the argument is neither visible nor invisible nothing will happen—tough.

```

1899 \use:c { @setupverb #1 space }
1900 \@vobeyspaces
1901 }

```

(End of definition for `\legacyverbatimsetup`. This function is documented on page 40.)

verbatim/startline (socket)

We might also need a
hook for line numbers.

A socket that is executed at the start of each verbatim line, to be used, for example, to check for `%_` when the `doc` package is active.

```

1902 \NewSocket{verbatim/startline}{0}

```

`\@setupverbinvisiblespace`

In the $\text{pdf}\text{\TeX}$ engine we need to use `\pdfspaces` chars for the invisible spaces. In luatex we do not want this as it would lead to doubling the number of real space chars. In dvi-mode we do not want that either: with pdftex it would error, with xetex it does nothing.

```

1903 <@@=block>
1904 \newcommand\@setupverbinvisiblespace{
1905   \bool_lazy_or:nnF
1906   { \sys_if_engine_luatex_p: }
1907   { \sys_if_output_dvi_p: }
1908   {

```

```

1909 \renewcommand\@setupverbinvisiblespace
1910 {\def\@xobeysp{\nobreakspace\pdfakespace}}
1911 }

```

(End of definition for \@setupverbinvisiblespace. This function is documented on page 40.)

The command \@setupverbvisiblespace is already defined in the kernel.

10.1.2 Helper commands for alltt and alltt*

\legacyallttsetup The `alltt` environment also needs some special setup. We can reuse `\legacyverbatimsetup` but we have to take out `\`, `{`, and `}` from `\dospecials` as they should remain available with their normal catcodes and adjust `'` inside math. This is lifted straight from the original package code.

```

1912 <@@=
1913 \ExplSyntaxOff

1914 \def\legacyallttsetup #1{%
1915   \let\org@prime~%
1916   \everymath\expandafter{\the\everymath
1917     \catcode\'=12 \let~\org@prime}%
1918   \everydisplay\expandafter{\the\everydisplay
1919     \catcode\'=12 \let~\org@prime}%

```

This alters `\dospecials`:

```

1920 \let\org@dosppecials\dosppecials
1921 \g@remfrom@sppecials{\}%
1922 \g@remfrom@sppecials{\}%
1923 \g@remfrom@sppecials{\}%

```

Then call `\legacyverbatimsetup`:

```

1924 \legacyverbatimsetup {#1}%

```

And afterwards restore `\dospecials`:

```

1925 \let\dosppecials\org@dosppecials
1926 }

```

Copied from `alltt`.

```

\g@remfrom@sppecials 1927 \def\g@remfrom@sppecials#1{%
1928   \def\@new@sppecials{}%
1929   \def\@remove##1{%
1930     \ifx##1#1\else
1931       \g@addto@macro\@new@sppecials{\do ##1}\fi}%
1932   \let\do\@remove\dosppecials
1933   \let\dosppecials\@new@sppecials
1934 }

1935 \ExplSyntaxOn
1936 <@@=block>

```

(End of definition for `\legacyallttsetup` and `\g@remfrom@sppecials`. These functions are documented on page 40.)

10.1.3 Helper command for legacy list environment

`\legacylistsetup` And here is the extra code for use in the list instance setup in the key `early-legacy-code`:

```
1937 \cs_new_protected:Npn \legacylistsetup {
```

Reset values to defaults:

```
1938     \dim_zero:N \listparindent
1939     \dim_zero:N \rightmargin
1940     \dim_zero:N \itemindent
```

By default a `list` environment is not numbered, but this happens already in the block template.

```
1941 %     \tl_set:Nn \@listctr {}
1942 %     \legacy_if_set_false:n { @nbrlist } % needed if lists are nested
```

By default there is a simple definition for `\makelabel`. It can be overwritten in the second mandatory argument to the list environment (stored in `\l_block_legacy_env_params_tl`) and is used if the instance sets the compatibility key to true.

```
1943     \let\makelabel\@mklab % TODO: customize
```

Now we use the argument with parameter settings to update some or all of the above defaults (this holds whatever was put into the second argument to the `list` environment):

```
1944     \l_block_legacy_env_params_tl
```

As we don't know much about this list we can only make a guess about the nature of the list and the setting of the tag name (default `list` role-mapped to `<L>`) and any tag attributes may have to be overwritten in the optional key/value argument. But we do have some hints to play with.

```
1945     \legacy_if:nTF { @nbrlist }
1946     { \tl_set:Nn \l_tag_L_attr_class_tl {enumerate} } % numbered list
1947     { \tl_if_empty:NTF \@itemlabel
1948       { \tl_set:Nn \l_tag_L_attr_class_tl {list} } % no label
1949       { \tl_set:Nn \l_tag_L_attr_class_tl {itemize} } % unnumbered,
1950                                     % unordered
1951     }
1952 }
```

(End of definition for `\legacylistsetup`. This function is documented on page 40.)

`\l_block_legacy_env_params_tl` The token list in which the declarations from the second argument of `list` are temporarily stored. This is then used in `\legacylistsetup`.

```
1953 \tl_new:N\l_block_legacy_env_params_tl
```

(End of definition for `\l_block_legacy_env_params_tl`.)

10.2 Theorem-like environments

Theorem-like environments are defined in $\text{\LaTeX}$ with the help of `\newtheorem` declarations. Internally they used a list with a single item. Using lists was convenient back then, but in a tagged document you end up with a strange structure. We therefore alter the mechanism.

10.2.1 Declarations for theorem-like environments

`\newtheorem` We reimplement the extended `amsthm` version of the declaration which also supports a star form indicating that this theorem-like environment should not be numbered.

```
1954 \RenewDocumentCommand \newtheorem { s m o m o } {
```

Is the environment definable at all? If not there is not much point in continuing.

```
1955 \expandafter\@ifdefinable\csname #2\endcsname
1956 {
```

If a star was given then there is no need to set up a counter for this environment. Otherwise we do what L^AT_EX2e did, except that we do all the variations in one go, rather than using `\@ynthm`, `\@xnthm`, and `\@othm`.

undefine the old internal commands?

```
1957 \IfBooleanF #1
1958 {
1959 \IfNoValueTF {#3}
```

If there was no counter to use (#2) then we set up a counter with the same name as the environment (#2).

```
1960 {
1961 \definecounter {#2}
```

If there was no “counter within” the counter representation is simple, otherwise we build it up from the two counters:

```
1962 \IfNoValueTF {#5}
1963 { % @ynthm
1964 \tl_gset:ce { the #2 }
1965 {
1966 \thmcounter{#2}
1967 }
1968 }
1969 { % @xnthm
1970 \@newctr{#2}[#5]
1971 \tl_gset:ce { the #2 }
1972 {
1973 \expandafter\noexpand\csname the#5\endcsname
1974 \@thmcountersep
1975 \@thmcounter{#2}
1976 }
1977 }
1978 }
1979 { % @othm
```

If we should reuse an existing counter (#3 was given) we check that this counter actually exists and if so use it:

```
1980 \@ifundefined{c@#3}
1981 { \@nocounterr{#3} }
1982 {
1983 \newcounteralias{#2}{#3}
1984 }
1985 }
1986 }
```

With the counter defined we are ready to declare the environments. There is a slight complication though: the “theorem-like” environments have an optional argument which contains a possible note, but now we also want to use the first optional argument to hold a key/value list with parameter settings. We therefore define this argument via `={note}o` so that a simple note, if given is assigned to a `note` key. Further processing is then delegated to the command `\ParseLaTeXeTheoremlike` which, after sorting out the argument situation, eventually calls `\BlockEnv`.

```
1987 \IfBooleanTF #1
```

The starred form of the environment suppresses the number so we pass it `\BooleanTrue`, otherwise it is identical to the normal definition.

```
1988 {
1989   \NewDocumentEnvironment{#2}{={optarg}o }
1990   { \ParseLaTeXeTheoremlike {#2} \BooleanTrue {##1} }
1991   { \BlockEnvEnd }
1992 }
1993 {
1994   \NewDocumentEnvironment{#2}{={optarg}o }
1995   { \ParseLaTeXeTheoremlike {#2} \BooleanFalse {##1} }
1996   { \BlockEnvEnd }
1997 }
```

Now it is about time to provide all necessary template instances. They depend on the `\theoremstyle` specified by the user and possibly by a `\swapnumbers` declaration. We start by checking the requested `\theoremstyle` (if none was given then `plain` is the default and if it is an unknown name we also revert to `plain` after issuing a warning).

```
1998 \IfInstanceExistsF{thmstyle}{\l__block_thmstyle_tl}
1999   { \@latex@warning{Unknown~ theoremstyle~
2000     '\l__block_thmstyle_tl'~ using~ 'plain'}
2001     \theoremstyle {plain}
2002   }
```

So now we know that `\l__block_thmstyle_tl` holds a valid style. What we don’t know is whether or not there are special block instances that go with that style (it might be a style that reuses the `thm-⟨style⟩block-...` instances).

```
2003 \IfInstanceExistsTF{block} { thm- \l__block_thmstyle_tl -1 }
2004 { \__block_debug_typeout:n{...~ style~ \l__block_thmstyle_tl\space exists } }
2005 { \__block_debug_typeout:n{...~ style~ \l__block_thmstyle_tl\space
2006   does~ not ~exist;~ 'plain'~ used } }
```

So here is the `blockenv` instance for the new “theorem-like” environment. It uses a `captionedtext` instance for the inner-instance which we also have to declare.

```
2007 \DeclareInstance{blockenv}{#2}{std}
2008 {
2009   name                = theorem-like
2010   ,tag-name           = \UseStructureName{block/theorem-like}
2011   ,tag-attr-class     =
2012   ,tagging-recipe     = standalone
2013   ,standalone         = true
2014   ,inner-level-counter =
2015   ,transparent-level  = true
2016   ,early-legacy-code  =
2017   ,late-legacy-code   =
```

What block instance to use is determined by checking if a special one exists or whether we should use plain:

```

2018      ,block-instance:e      = thm-
2019                               \IfInstanceExistsTF{block}
2020                               {thm- \l__block_thmstyle_tl -1}
2021                               { \l__block_thmstyle_tl } { plain }
2022      ,inner-instance-type     = captionedtext
2023      ,inner-instance          = #2

```

By default the body text is justified, but perhaps we should not set anything here and use whatever is current.

```

2024      ,para-instance          = justify
2025      }

```

The `captionedtext` instance is simple: the counter, if present, is either argument #2 or #3; the title receives argument #4, and the style to use is stored in `\l__block_thmstyle_tl`. If `\swapnumbers` was requested we use a style variant with the suffix `-swap` appended.

```

2026      \DeclareInstance{captionedtext}{#2}{thmlike}
2027      {

```

The counter to use is either none or #2 based on the arguments given:

```

2028      ,counter:e = \IfBooleanF #1 { #2 }
2029      ,title      = #4
2030      ,style:e     = \l__block_thmstyle_tl
2031                  \bool_if:NT \l__block_swap_number_bool {-swap}
2032      }

```

We already know that the style `\l__block_thmstyle_tl` exists, since we have tested that earlier, but we don't know if that is also true for the `-swap` variant. So we have to check that and declare it if necessary.

```

2033      \bool_if:NT \l__block_swap_number_bool {
2034          \IfInstanceExistsF{thmstyle}{\l__block_thmstyle_tl -swap}
2035      {

```

If it doesn't exist we first make a copy of the base instance.

```

2036          \DeclareInstanceCopy{thmstyle}
2037              {\l__block_thmstyle_tl -swap}
2038              {\l__block_thmstyle_tl}

```

Then we retrieve the value of the `order` key from that instance which is a clist.

```

2039      \clist_set:Nc \l__block_order_clist
2040      { \InstanceValue { thmstyle }
2041        { \l__block_thmstyle_tl }
2042        { order }
2043      }

```

Then we step through this clist and build a new one in `\l__block_tmp_clist` with the `title` and `number` swapped. That is done under the assumption that both actually exist in the clist which would be the case if the instance was declared with `\newtheoremstyle`, i.e., for legacy setups.

```

2044      \clist_clear:N \l__block_tmp_clist
2045      \clist_map_inline:Nn \l__block_order_clist

```

```

2046         {
2047             \clist_put_right:Ne \l__block_tmp_clist {
2048                 \str_case:nnF {##1}
2049                     { {title} {number}
2050                       {number} {title} }
2051                     {##1}
2052             }
2053         }

```

Once that is done we put the new value for `order` in the new instance.

```

2054         \EditInstance {thmstyle}{\l__block_thmstyle_tl -swap}
2055         { order:e = \l__block_tmp_clist }
2056     }
2057 }
2058 }
2059 }

```

(End of definition for `\newtheorem`.)

`\ParseLaTeXeTheoremlike` The arguments to `\ParseLaTeXeTheoremlike` are as follows:

- #1: instance name to use (of type “blockenv”)
- #2: unnumbered? boolean normally provided by using the star form of the environment
- #3: key/val for layout adjustments settings provided in the optional argument of the “theorem-like” environment. If a note to the theorem was given in that argument, then it has been turned into `note...=`

To be able to pick up the `note`, if provided, we make the following declaration:

```

2060 \keys_define:nn {blockenv} {
2061     , optarg      .tl_set:N = \l__block_optarg_tl
2062     , optarg      .groups:n = { interface }
2063 }

2064 \cs_new_protected:Npn \ParseLaTeXeTheoremlike #1 #2 #3 {
2065     %
2066     % \__block_debug_typeout:n{Parse~#1~ Arguments~ found:~ \IfBooleanT{#2}{*}
2067     % \IfValueT{#3}{[\exp_not:n{#3}]}
2068     %

```

Normally, no note is provided, so that’s the starting point:

```

2069     \tl_set:Nn \l__block_optarg_tl { \NoValue }

```

Then we check #3 if it contains a key/val list containing `note`. This then sets `\l__block_optarg_tl` and puts all other key/vals in `\l__block_instance_keys_tl`. Otherwise the complete key/val list ends up there.

```

2070     \IfNoValueTF { #3 }
2071     { \tl_clear:N \l__block_instance_keys_tl }
2072     { \keys_set_groups:nnnN {blockenv} {interface} { #3 }
2073       \l__block_instance_keys_tl }

```

We are now ready to invoke the `blockenv` instance for `#1` but we need to expand some of the values first, hence the `\use:e`.

```
2074 \use:e {
2075   \exp_not:N \BlockEnv { #1 }
2076   { \exp_not:o \l__block_instance_keys_tl }
2077   { #2 }
```

We put the contents of `\l__block_optarg_tl` in the title argument. For normal `thmlike` environments this is the right place, for the `proof` environment we have to move it from there to overwrite the `\proofname`.

```
2078   { \exp_not:o \l__block_optarg_tl }
2079 }
```

We don't have any use for the last argument (the sub-caption) in the standard setup, so we pass `\NoValue`.

```
2080   \NoValue
2081 }
```

(End of definition for `\ParseLaTeXeTheoremlike`. This function is documented on page ??.)

`\l__block_instance_keys_tl` Variable used above.

```
2082 \tl_new:N \l__block_instance_keys_tl
```

(End of definition for `\l__block_instance_keys_tl`.)

`\swapnumbers` Beside declaring theorem-like environments with `\newtheorem` and `\theoremstyle`, the `amsthm` package also introduced `\swapnumbers` to swap title and number in all environments (because that is a common requirement). The new implementation supports this approach as well.

It is implemented with a boolean `\l__block_swap_number_bool` which is toggled by `\swapnumbers`.

```
2083 \bool_new:N \l__block_swap_number_bool
2084 \cs_new_protected:Npn \swapnumbers { \bool_set_inverse:N \l__block_swap_number_bool }
```

(End of definition for `\swapnumbers`. This function is documented on page ??.)

`\newtheoremstyle` The `\newtheoremstyle` declaration was originally provided in the `amsthm` package. It has 9 mandatory arguments that sets some aspects of theorem styles. We map those to the template mechanism and generate `thmstyle` instances from them. Some of its default differ between the `pkgamsthm` package version and the version in the document classes. To account for this we set them up in macros that can be overwritten. We use a 2e name for that.

```
2085 \tl_new:N \newtheoremstyle@vspace@default
2086 \tl_set:Nn \newtheoremstyle@vspace@default { \topsep }
```

`\newtheoremstyle` has a bunch of argument conventions that haven't been fully implemented yet, e.g., `#8` can be a blank (meaning normal word space or `\newline`) or a skip.

Those should eventually also be covered.

```
2087 \cs_set_protected:Npn \newtheoremstyle #1#2#3#4#5#6#7#8#9 {
```

extend

First we build a `thmstyle` instance:

```

2088 \DeclareInstance{thmstyle}{#1}{std}{
2089   ,caption-decls   = {#6}
2090   ,before-hspace:e = \tl_if_empty:nTF{#5}{0pt}{#5}
2091   ,body-decls      = {#4}
2092   ,punct           = {#7}
2093   ,order           = {title,separator-a,number,separator-b,note,punct}
2094   ,number-decls    = \upshape
2095   ,note-decls      = \upshape\mdseries

```

This setting doesn't cover all syntax possibilities so far.

```

2096   ,after-hspace:e = \tl_if_empty:nTF{#8}{0pt}
2097                   {\tl_if_blank:nTF{#8}{3.3pt}{#8}}
2098 }

```

If `#2` or `#3` are not empty we also have to set up a `block` instance to account for the fact that special vertical spacing is requested. We base this on `thm-legacy2e-1` so that most parameters already have correct values. (Starting from scratch is difficult because we don't know if the current class defines defaults in `\@listi` and friends, so one would need to account for that.) Fix end-vspace setting (tagging/1362)

```

2099 \tl_if_empty:nF { #2#3 }
2100 {
2101   \DeclareInstanceCopy{block}{thm-#1-1}{thm-legacy2e-1}
2102   \EditInstance{block}{thm-#1-1}{
2103     ,begin-vspace:e = \tl_if_empty:nTF{#2}
2104                     { \newtheoremstyle@vspace@default }{#2}
2105     ,end-vspace:e   = \tl_if_empty:nTF{#3}
2106                     { \newtheoremstyle@vspace@default }{#3}
2107   }

```

As elsewhere we provide two levels.

```

2108   \DeclareInstanceCopy{block}{thm-#1-2}{thm-#1-1}
2109 }

```

More complicated is argument `#9`. If not empty it can contain `\thmname`, `\thmnumber`, and/or `\thmnote` to define the layout of the theorem caption. All the spacing has to be given inside the arguments of these commands which means that this doesn't work together with `\swapnumbers`, but this is the way `amsthm` was defined. If the instances are manually defined then it is easy to make them work with and without a `\swapnumbers` declaration. So basically, this here is good for a subset of cases and for backwards compatibility with `amsthm`.

The approach used doesn't cover all circumstances, e.g., if the argument contains low-level programming on top of the interface commands that the translation below will fail, but most existing code should work and the rest would need a replacement using instances that are directly set up.

```

2110 \tl_if_empty:oF { \exp_not:n{#9} }
2111 {

```

Give special definitions for the commands and then expand `#9` and use the result to edit the instance we defined earlier.

```

2112   \cs_set:Npn \thmname   ##1 {title-format={\exp_not:n{##1}}},
2113   \cs_set:Npn \thmnumber ##1 {number-format={\exp_not:n{##1}}},
2114   \cs_set:Npn \thmnote   ##1 {note-format={\exp_not:n{##1}}},

```

```

2115     \cs_set:Npn \__block_tmp:w ##1##2##3 {
2116       \exp_args:Nne \EditInstance{thmstyle}{#1}{#9}}
2117     \__block_tmp:w {##1} {##1} {##1}

```

We then also use the commands to deduce a suitable `order` and put that into the instance as well.

```

2118     \cs_set:Npn \thmname    ##1 {title,}
2119     \cs_set:Npn \thmnumber  ##1 {number,}
2120     \cs_set:Npn \thmnote    ##1 {note,}
2121     \cs_set:Npn \__block_tmp:w##1##2##3 {
2122       \exp_args:Nne \EditInstance{thmstyle}{#1}{order={#9 punct}}}}
2123     \__block_tmp:w {##1} {##1} {##1}
2124   }

```

If block tracing is turned on we show the final result:

```

2125   \__block_debug:n { \ShowInstanceValues{thmstyle}{#1} }
2126 }

```

(End of definition for `\newtheoremstyle`. This function is documented on page 40.)

10.2.2 Supporting QED in proofs

The `amsthm` package contains some elaborate code to support placing a QED symbol into the proof (by default at the end, but alternatively manually placed with `\qedhere`). This code is simply lifted and not adjusted in any way for now (and therefore also not documented—see the `amsthm` package for documentation for now).

```

2127 \ExplSyntaxOff
2128 \def\math@qedhere{%
2129   \@ifundefined{\@currentenv @qed}{%
2130     \qed@warning\quad\hbox{\qedsymbol}%
2131   }{%
2132     \xp@aftergroup\csname\@currentenv @qed\endcsname
2133   }%
2134 }
2135 \def\displaymath@qed{%
2136   \relax
2137   \ifmmode
2138     \ifinner \aftergroup\linebox@qed
2139   \else
2140     \eqno
2141     \let\eqno\relax \let\leqno\relax \let\veqno\relax
2142     \hbox{\qedsymbol}%
2143   \fi
2144   \else
2145     \aftergroup\linebox@qed
2146   \fi
2147 }

```

The `\linebox@qed` is intended for the case that the `fleqn` option is used. The way `\displaymath@qed` is written it would also apply in somewhat strange constructs such as `\text{... $ ... \qedhere$}` but this seems to be more a side effect rather than some deliberate coding choice by Michael Downes.

```

2148 \def\linebox@qed{\hfil\hbox{\qedsymbol}\hfilneg}

```

```

2149 \expandafter\let\csname equation*@qed\endcsname\displaymath@qed
2150 \def\equation@qed{%
2151   \iftagsleft@
2152     \hbox{\phantom{\quad\qedsymbol}}%
2153     \gdef\alt@tag{%
2154       \rlap{\hbox to\displaywidth{\hfil\qedsymbol}}%
2155       \global\let\alt@tag\@empty
2156     }%
2157   \else
2158     \gdef\alt@tag{%
2159       \global\let\alt@tag\@empty
2160       \vtop{\ialign{\hfil###\cr
2161         \tagform@theequation\cr
2162         \qedsymbol\cr}}%

```

The original code in amsthm only contained `\setbox\z@` at this point to remove `\hbox` produced by `\maketag@_block`. However, when the sockets for the tagging are added this doesn't work any more because they come between the `\setbox` and the `\hbox`. We therefore set `measuring@` to true so that the branch without the sockets is used.

```

2163   \measuring@true
2164   \setbox\z@
2165 }%
2166 \fi
2167 }
2168 \def\qed@tag{%
2169   \global\tag@true \nonumber
2170   &\omit\setboxz@h {\strut@ \qedsymbol}\tagsleft@false
2171   \place@tag@gather
2172   \kern-\tabskip
2173   \ifst@rred \else \global\@eqnswtrue \fi \global\advance\row@ \@ne \cr
2174 }
2175 \def\split@qed{%
2176   \def\endsplit{\crcr\egroup \egroup \ctagsplit@false \rendsplit@
2177     \aftergroup\align@qed
2178   }%
2179 }
2180 \def\align@qed{%
2181   \ifmeasuring@ \tag*{\qedsymbol}%
2182   \else \let\math@cr@@@ \qed@tag
2183   \fi
2184 }
2185 \expandafter\let\csname align*@qed\endcsname\align@qed
2186 \expandafter\let\csname gather*@qed\endcsname\align@qed
2187 %
2188 \DeclareRobustCommand{\qed}{%
2189   \ifmmode \mathqed
2190   \else
2191     \leavevmode\unskip\penalty9999 \hbox{}\nobreak\hfill
2192     \quad\hbox{\qedsymbol}%
2193   \fi
2194 }%
2195 \let\QED@stack\@empty
2196 \let\qed@elt\relax
2197 \newcommand{\pushQED}[1]{%

```

```

2198 \toks@{\qed@elt{#1}}\@temptokena\expandafter{\QED@stack}%

2232 \providecommand{\qedsymbol}{\openbox}
2233 \ExplSyntaxOn

```

11 Support for other packages and classes

11.1 Replacement for alltt

The tools package alltt by Leslie Lamport has been completely implemented using the template approach and is therefore no longer necessary. In fact it has also been extended by providing alltt*.

```

2234 \expandafter\let\csname ver@alltt.sty\endcsname\fmtversion

```

11.2 Replacement for amsthm

The amsthm package is basically supported out of the box (though there are currently still a few limitation with \newtheoremstyle and perhaps also in other places). So this

here is a bit premature, but for now we disable loading `amsthm` and wait to see how far this gets us. We may have to provide a bit more for better compatibility.

```
2235 \expandafter\let\csname ver@amsthm.sty\endcsname\fmtversion
```

11.3 Support for `amsart` and `amsbook` classes

Unfortunately, the `amsart` class contains a full implementation of `amsthm` inside the class (why ever) and they use `\newcommand`, sigh.

Thus, to make the new code work with this class we have to hide some definitions, load the class and only afterwards restore our own versions.

So first save some of the problematical definitions under some other names:

```
2236 \let \amsnewtheorem \newtheorem
2237 \let \amsnewtheoremstyle \newtheoremstyle
2238 \let \amstheoremstyle \theoremstyle
2239 \let \amsproof \proof
2240 \let \amsendproof \endproof
```

Then undefine them just before the class gets loaded (quite a handful):

```
2241 \AddToHook{class/amsart/before}[block]{
2242   \let \newtheoremstyle \relax
2243   \let \theoremstyle \relax

2244   \let \proof \relax
2245   \let \endproof \relax

2246   \let \pushQED \relax
2247   \let \popQED \relax
2248   \let \qedhere \relax
2249   \let \mathqed \relax
2250   \let \openbox \relax
2251 }
```

Same for `amsbook` and `amsproc`:

```
2252 \AddToHook{class/amsbook/before}[block]{
2253   \let \newtheoremstyle \relax
2254   \let \theoremstyle \relax
2255   \let \proof \relax
2256   \let \endproof \relax
2257   \let \pushQED \relax
2258   \let \popQED \relax
2259   \let \qedhere \relax
2260   \let \mathqed \relax
2261   \let \openbox \relax
2262 }

2263 \AddToHook{class/amsproc/before}[block]{
2264   \let \newtheoremstyle \relax
2265   \let \theoremstyle \relax
2266   \let \proof \relax
2267   \let \endproof \relax
2268   \let \pushQED \relax
2269   \let \popQED \relax
2270   \let \qedhere \relax
```

```

2271 \let \mathqed \relax
2272 \let \openbox \relax
2273 }

```

And once the class is loaded restore our versions again. Note that we don't have to restore all the QED-related commands as ours are identical to those defined by the AMS.

```

2274 \AddToHook{class/amsart/after}[block]{
2275 \let \newtheorem \amsnewtheorem
2276 \let \newtheoremstyle \amsnewtheoremstyle
2277 \let \theoremstyle \amstheoremstyle
2278 \let \proof \amsproof
2279 \let \endproof \amsendproof
2280 }

2281 \AddToHook{class/amsbook/after}[block]{
2282 \let \newtheorem \amsnewtheorem
2283 \let \newtheoremstyle \amsnewtheoremstyle
2284 \let \theoremstyle \amstheoremstyle
2285 \let \proof \amsproof
2286 \let \endproof \amsendproof
2287 }

2288 \AddToHook{class/amsproc/after}[block]{
2289 \let \newtheorem \amsnewtheorem
2290 \let \newtheoremstyle \amsnewtheoremstyle
2291 \let \theoremstyle \amstheoremstyle
2292 \let \proof \amsproof
2293 \let \endproof \amsendproof
2294 }

```

11.4 Support for the `enumitem` interfaces

The current implementation incorporates most features of `enumitem`. The plan is that the `enumitem` interfaces are either natively available or are emulated and mapped to new interfaces, so that documents using `enumitem` work seamlessly.

Most (or even all of the `enumitem` keys have gotten new names, so there the task is to map old names to new names. One question to decide here is which (if any) of the original keys should remain natively available even if `enumitem` is not loaded, and which should only be supported if the document explicitly loads `enumitem`, i.e., support them only for compatibility with old documents. Providing the full set by default means one ends up with a fairly inconsistent interface, but not providing some of them may result in people unnecessarily loading `enumitem` in new documents just to get at, say, `nosep`.

The `enumitem` package also provides declarations to build out new lists and adjust the layout of existing list using commands like `\newlist` or `\setlist`. With the new implementation this is normally done differently, e.g., defining instances and simple document level commands via `\SimpleBlockEnv`, etc. However, we probably also want a declaration such as `\newlist` (same name?) to provide a simple way to make this happen in the document preamble in one go.

I'm less sure about `\setlist` at least as far as its optional argument is concerned (even though we have to support it in an emulation).

decide

decide

We put the code that emulates `enumitem` in a separate file to be loaded instead of the original package, but eventually some of the code from there has to move back to the kernel to be always present.

```
2295 %\declare@file@substitution{enumitem.sty}{latex-lab-enumitem.sty}
```

But for now we simply disable `enumitem` loading and unconditionally load our replacement into the kernel for ease of testing. In the end we have to decide which parts of the interface (if any) we provide out of the box and which parts are only available if the document requests `enumitem`.

We do pretend, however, that `enumitem` has been loaded so that code testing for that takes the right branch.

```
2296 \expandafter\let\csname ver@enumitem.sty\endcsname\fmtversion
2297 \RequirePackage{latex-lab-enumitem}
```

11.5 Support for the `doc` package

When the `doc` package is loaded it wants to remove a `%` sign from the start of each verbatim line. For this it uses `\check@percent` which we stick into the `verbatim/startline` socket.

`doc (plug)`

```
2298 \NewSocketPlug {verbatim/startline}{doc}{ \check@percent }
2299 \AddToHook{package/doc/after}{
2300   \AssignSocketPlug{verbatim/startline}{doc}
2301 }
2302 </package-finish>
```

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
