1 Introduction

The list implementation in $\text{\LaTeX} 2_{\epsilon}$ serves a dual purpose: it implements real lists such as `itemize` or `enumerate`, but it is also used as the basis for vertical blocks, i.e., to specify the vertical spacing and paragraph handling after such block, e.g., in environments like `center`, `quote`, `verbatim`, or in the theorem environments. They are all implemented as “trivial” lists with a single (hidden) item.

While this was convenient to get a consistent layout using a single implementation it is not adequate if it comes to interpreting the structure of a document, because environments based on `trivlist` should not advertise themselves as being a “list” — after all, from a semantic point of view they aren’t lists.

The approach taking here is therefore to offer separate template types: `block` (horizontally or vertically oriented data that needs some handling at the start and the end), `para` (that deals with different paragraph layouts), `list` (that handles list related parameters, and `item` (for item layouts and handling).

To address the independent aspects we have the template type `blockenv` that ties them together as necessary when we build document level environments.

For example, a `quote` environment would make use of a (display) `block` and some `para` instance while a standard `enumerate` would make use of a display `block`, a `list`, and an `item` and a `para` instance. An inline list (like `enumerate*` from the `enumitem` package) would be using the same `list` instance but a different (horizontally oriented) `block` instance build from a different template.

Instead of a `list` instance to handle the inner structure of the environment one can use an instance of the type `captionedtext` to produce a display environment with an associated heading/caption, such as a theorem-like environment or a proof environment. Further possibilities (not yet implemented) are templates for producing boxed text or formal quotes like those produced by the `csquotes` package.

2 Template types and templates for blocks and lists

2.1 Template types

2.1.1 The template type ‘`blockenv`’

Arg: 1 key/value list to alter the default parameters of the template instances used by the particular `blockenv` environment

Arg: 2 Boolean to suppress a number in case this environment normally produces a numbered caption

Arg: 3 Caption/heading/note text supplied from the document, in case this environment supports a caption (most don’t), otherwise `\NoValue`

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption (most don’t), otherwise `\NoValue`

Semantics:

This template type is used to implement document-level environments. It defines a `block` instance to handle the layout at the “edge” of the environment data, possibly some paragraph setup through a `para` instance, potentially an “inner” instance for more

complicated environments (such as lists), and possibly some additional setup code for certain environments.

Arguments 2–4 are passed to the instance handling the inner structure, e.g., `list` or `captionedtext` which may or may not make use of it.

It also defines how the `blockenv` behaves with respect to nesting, e.g., does it change when nested and if so how many levels of nesting are supported, etc.

Finally, the template type defines how it appears in a tagged PDF document, what tag names are used, how they are role-mapped and whether it adds additional attributes, etc.

2.1.2 The template type ‘block’

Arg: 1 key/value list to alter the default block parameters

Semantics:

Handle the layout aspects of a block of data. In case of a “display” block (i.e., vertically oriented) the spacing and page breaking as well as the handling if the block starts a paragraph or ends one, that is, if text is immediately following the block without being separated by an empty line, then this text is considered to be in the same paragraph as the block.

In case of a horizontally oriented block it covers any special handling at the start and end of the block, e.g., extra spacing, prohibiting or encouraging line breaks, and so forth.

2.1.3 The template type ‘para’

Arg: 1 key/value list to alter the default paragraph parameters

Semantics:

Sets up paragraph-specific parameters for H&J, e.g., to implement justification variations, the behavior of `\\` etc. The instances are used in higher-level templates, e.g., in a `block`.

2.1.4 The template type ‘list’

Arg: 1 key/value list to alter the default list parameters

Arg: 2 Boolean to suppress a number in case this list environment also produces a numbered heading/caption.

Arg: 3 Caption/heading/note text in case this environment supports a caption (lists normally don’t), otherwise `\NoValue`.

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

Handle the aspects related to list design, e.g., the use and formatting of counters, etc.

Standard $\text{\LaTeX} 2_{\epsilon}$ lists have no heading/caption, so arguments 2–4 are ignored in the standard `list` template. But special lists, such as a list of ingredients for a cookbook, might so there might be other templates that make use of them in the future.

Note that this template type does not cover block-related aspects, i.e., a list instance could be used both for a display list or for an inline list.

2.1.5 The template type ‘item’

Arg: 1 key/value list to alter the default item parameters.

Semantics:

A sub-type used as part of `list` to easily cover alternative layout for list items.

2.1.6 The template type ‘captionedtext’

Arg: 1 key/value list to alter the default captionedtext parameters.

Arg: 2 Boolean to suppress a number in case this environment also produces a numbered heading/caption.

Arg: 3 Caption/heading/note text as specified in the document for this text block; if not given then `\NoValue`. In case of theorem-like environments this is best to be considered as the explanatory note as the main part of the caption is fixed in that case.

Arg: 4 Sub-caption/heading/note text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

Produces a text block with an associated caption/heading/note, e.g., a theorem-like environment would consist of a caption made from a fixed string, possibly a number and an optional user-specified note. There may not be a user-supplied caption text—the caption may consist of a fixed text only like “Lemma”.

Handles the aspects related to the caption design and typically supports keys for adjusting the layout of the body text, e.g., its font, etc.

Note that this template type does not cover block-related aspects, e.g., the dimensions of the display block are handled there.

2.1.7 The template type ‘thmstyle’

Arg: 1 key/value list to alter the default thmstyle parameters.

Arg: 2 Boolean to suppress a number in case this environment also produces a numbered heading/caption.

Arg: 3 Caption/heading text for this text block; if not given then `\NoValue`.

Arg: 4 Sub-caption/heading text in case this environment supports a caption, otherwise `\NoValue`.

Semantics:

A sub-type used as part of `captionedtext` when producing theorem-like environments. It does the bulk of the work and sets up most of the formatting. It has been separated out because many theorem-like environments use the same theorem layout and only differ in the fixed caption text they generate.

Not all templates of type `captionedtext` use `thmstyle` as an inner instance, e.g., proofs are implemented with a template that does everything necessary directly.

2.2 Templates

2.2.1 The `blockenv` template ‘std’

Attributes:

name (*tokenlist*) Name of the environment used in tracing and error messages.

tag-name (*tokenlist*) Name of the tag used for the block inside the PDF. If not explicitly given the name is defined by the `tagging-recipe`. Note that in case of `tagging-recipe=basic` no tag for the block is produced, so any key settings are ignored.
Default: `<empty>`

tag-attr-class (*tokenlist*) An explicit tag class attribute. Default: `<empty>`

tagging-recipe (*tokenlist*) Defines the way tagging is done. Currently the values `basic`, `standard`, `list`, and `standalone` are supported. The latter implies that the key `standalone` is set to true
Default: `standard`

standalone (*boolean*) If true, surrounds the environment implicitly with `\par` commands. Forced to true when `tagging-recipe` is `standalone`.
Default: `false`

transparent-level (*boolean*) Is this `blockenv` transparent for any blocks nested inside?
Default: `false`

early-legacy-code (*tokenlist*) Legacy setup code. This is executed after legacy defaults (from `\@listi`, `\@listii`, etc.) are used but before the block instance is called. At this point we may still be in horizontal mode! This means settings that alter paragraph parameters such as `\baselineskip` should **not** be used because they would affect preceding text! Use `late-legacy-code` for that instead in a display environment.
Default: `<empty>`

late-legacy-code (*tokenlist*) Legacy setup code. This is called after the **block** and **para** instances are processed but before the inner instance is called. At this point we are in vertical mode in a display environment and something like `\small` is not affecting preceding text. Default: `\empty`

block-instance (*tokenlist*) Part of the name of the **block** instance that is called. The full name has a `-<level>` appended. Default: `std-display`

para-instance (*tokenlist*) Paragraph settings to use within the environment. If `\empty` then the current (outer) values are retained. However, the **inner-instance** template might reset/overwrite some of the **para** values, e.g., **list** makes use of `\listparindent` to explicitly set the paragraph indentation for compatibility. Default: `\empty`

inner-level-counter (*tokenlist*) Name of an existing (!) counter that is incremented and used to determine final name of the **inner-instance** or empty if always the same inner instance should be used.

max-inner-levels (*tokenlist*) Maximum number of nested environments of this kind. Only relevant if there is a **inner-level-counter** specified. Default: 4

inner-instance-type (*tokenlist*) Template type of the inner instance. Currently supported types are **list** and **captionedtext**. Default: `\empty`

inner-instance (*tokenlist*) Name of the inner instance (if any). If there is an **inner-level-counter** then the instance name gets `-<counter value>` appended. Default: `\empty`

tagging-suppress-paras (*boolean*) *describe* Default: false

final-code (*tokenlist*) Final setup code Default: `\ignorespaces`

Semantics & Comments: The **blockenv** type handles the overall setup for the document-level environments.

This **blockenv** template supports the legacy list setting that are found in many document classes in the macros `\@listi`, `\@listii`, up to `\@listvi`. It also uses the counter `\@listdepth` to track nesting of block, again mainly to support legacy setups (internally it gives it a more appropriate name but it remains accessible through the $\text{\LaTeX} 2_{\epsilon}$ name).

The internal block nesting level is stored (for historical reasons) in the `\@listdepth` counter and incremented by each block by one. The starting value at top-level (outside any block) is zero. A block environment with **transparent-level=true** also increments the level before it evaluates and sets its parameters but then decrements it again, just before it starts processing its body.

The template first checks that the block is not too deeply nested.

After the level was increased then corresponding `\@list...` macro to update the legacy defaults is called.

It then sets up the tagging via the **tagging-recipe** setting and executes any code in **early-legacy-code**.

Afterwards it calls the appropriate **block** instance based on **block-instance** and current level, e.g., `std-display-1`.

Then it sets up paragraph parameters if a **para-instance** was specified (otherwise they stay as they are).

If a **inner-instance** was specified this is called next, or more precisely: if no **inner-level-counter** was specified the instance **inner-instance** is called.

Otherwise, the **inner-level-counter** is incremented and the instance with the name **inner-instance-inner-level-counter** is called.

Finally, the **final-code** is executed (by default `\ignorespaces`).

The maximum number of **blockenvs** that can be nested into each other is restricted by the $\text{\LaTeX}$ counter **maxblocklevels** with a default value of 6. If this value is increased then it is necessary to provide additional instances, e.g., **std-display-7**, etc. Decreasing is, of course, always possible, then some of the instances defined are not used and instead the user gets an error that there is too much nesting going on.

If the key **transparent-level** is set to **true** then such an environment alters the nesting level only temporarily (while processing the **blockenv** template) and you can therefore nest those environments as often as you like (a typical example would be **flushleft** anywhere in the nesting hierarchy) as long as the level isn't already at **maxblocklevels**).

2.2.2 The block template ‘std’

Attributes:

- begin-vspace** (*skip*) Vertical space before the block. Default: `\topsep`
- begin-extra-vspace** (*skip*) Extra vertical space before the block if the block forms its own paragraph. Default: `\partopsep`
- begin-unchained-vspace** (*skip*) Vertical space before the block to use if this is a nested block, both blocks have items or captions, and these should not be chained; see description below. Default: `.5\topsep`
- para-vspace** (*skip*) The default for ordinary blocks is to use the `\parskip` from the outer galley. In lists and some other special blocks this is then changed. Default: `\parskip`
- end-vspace** (*skip*) Vertical space after the block. Default: value from **begin-vspace**
- end-extra-vspace** (*skip*) Extra vertical space after the block if the block forms its own paragraph. Default: value from **begin-extra-vspace**
- item-vspace** (*skip*) The space in front of an item if the block is a list; if not, the setting has no effect. Default: `\itemsep`
- begin-penalty** (*integer*) Penalty for breaking before the block. Default: `\@beginparpenalty`
- end-penalty** (*integer*) Penalty for breaking after the block. Default: `\@endparpenalty`
- item-penalty** (*integer*) Penalty for breaking before an item in the list (except the first). Default: `\@itempenalty`
- left-margin** (*length*) Space on the left of the block. Default: `\leftmargin`

right-margin (*length*) Space on the right of the block. Default: `\rightmargin`

para-indent (*length*) Paragraph indentation for paragraphs within the block.
Default: `0pt`

Semantics & Comments: Sets up the main block parameters, e.g. its spacing before and after and the indentation on either side.

It also sets up some parameter defaults for the inner level, e.g., **item-penalty**, **item-vspace** and **para-indent**, which may get overwritten by inner instances that are called.

The vertical spacing before the block covers four different use cases: If there is a caption or an item waiting to be placed, and this item allows for “chaining”, and the new block also wants to place an item then no space is added (spacing was already added by the outer block). Instead, the items are chained and placed that the start of the block, i.e., producing a layout like the two nested **itemize** environments here:

- – A second-level item
 – Another ...
 More text for the first-level item
- Another first-level item

In that case there is also no vertical space after the block. If the items should not be chained (as specified by the setup of the outer block), then one gets a result like this one (using **itemize** environments inside **description** with different treatment of individual description `\items`):

An normal label • A second-level item
 • Another ...
 More text for the first-level item

An unchained label

- A second-level item
- Another ...

More text for the first-level item

A normal label Another first-level item

If “unchaining” happens, as in the second item, then vertical spacing with the value of **begin-unchained-vspace** is used and at the end you get **end-vertical-space**.

Otherwise, if there is no item or caption waiting to be placed you get a vertical space of **begin-vspace** before the block and if the block is its own paragraph you additionally get **begin-extra-vspace** added to this.

Note that $\text{\LaTeX} 2_{\epsilon}$ always chained the list items, so the ability to prohibit this is a new functionality.

2.2.3 The para template ‘std’

Attributes:

para-indent (<i>length</i>)	Default: <code>\parindent</code>
begin-hspace (<i>skip</i>)	Horizontal skip added just in front of the indentation box if non-zero Default: <code>0pt</code>
left-hspace (<i>skip</i>)	Default: <code>0pt</code>
right-hspace (<i>skip</i>)	Default: <code>0pt</code>
end-hspace (<i>skip</i>)	Default: <code>\@flushglue</code>
fixed-word-spaces (<i>boolean</i>)	Default: <code>false</code>
final-hyphen-demerits (<i>integer</i>)	Default: <code>5000</code>
newline-cmd (<i>function(0)</i>)	This defines the meaning of <code>\\</code> Default: <code>\@normalcr</code>
para-attr-class (<i>tokenlist</i>)	Default: <code>justify</code>

Semantics & Comments: The `begin-hspace` (normally `0pt`) is the counterpart of `end-hspace` (which is normally `0pt plus 1fil`). It can be useful in special paragraph shapes. The skip is only inserted into the paragraph if it is non-zero. If it is made non-zero then paragraphs are always at least one line including a construct like `\noindent\par!`

The `para-attr-class` takes one of the attributes `justify`, `center`, `raggedright`, `raggedleft`. They are declared in `latex-lab-namespace`.

TODO: to be further documented

2.2.4 The list template ‘std’

Attributes:

counter (<i>tokenlist</i>)	Counter name to be used in a numbered list or empty, if the list is unnumbered. Default: <code>\empty</code>
item-label (<i>tokenlist</i>)	Label “string” for a fixed label or as generated from the current counter value. Default: <code>\empty</code>
start (<i>integer</i>)	Start value for the counter if the list is numbered, otherwise irrelevant. Default: <code>1</code>
resume (<i>boolean</i>)	Should a numbered list be resumed from the last instance? If true value of <code>start</code> is ignored. Default: <code>false</code>
item-instance (<i>instance</i>)	Instance of type <code>item</code> to be used to format the label string. Default: <code>basic</code>
item-vspace (<i>skip</i>)	The space in front of an item in the list. If not specified the value specified in the block template instance is used.

item-penalty (*integer*) Penalty for breaking before an item (except the first). If not specified the value specified in the block template instance is used.

item-indent (*length*) Horizontal displacement of the item. Default: 0pt

label-width (*length*) Width reserved for the formatted item label.
Default: \labelwidth

label-sep (*length*) Horizontal separation between label and following text.
Default: \labelsep

legacy-support (*boolean*) Is formatting the label via \makelabel supported?
Default: false

Semantics & Comments: Sets up handling of list material, e.g., numbering (if any), layout of items and list elements, and tagging, if requested.

2.2.5 The item template ‘std’

Attributes:

counter-label (*function1*) *unused*. Default: \arabic{#1}

counter-ref (*function1*) *unused*. Default: value from counter-label

label-ref (*function1*) Referencing items with optional arguments.

label-autoref (*function1*) *unused*. Default: item #1

label-format (*function1*) Formatting of the label, questionable the way it is used.
Default: #1

label-strut (*boolean*) Add a \strut to the label? Default: false

label-align (*choice*) Supported values left, center, right, and parleft. *Only partly implemented*. Default: right

label-placement (*choice*) Placement of the label in relation to a directly following label (of a following inner list). Supported values are chained, unchained, and standalone. Default: chained

label-boxed (*boolean*) Should the label be boxed? Default: true

next-line (*boolean*) Default: false

text-font (*tokenlist*) *unused*.

compatibility (*boolean*) Default: true

Semantics & Comments: This template is only rudimentary implemented at the moment. It probably needs other keys and the existing ones need a proper implementation!

fix

2.2.6 The `captionedtext` template ‘`thmlike`’

Attributes:

- numbered** (*boolean*) Is this kind of environment numbered? Default: `true`
- counter** (*tokenlist*) Counter name to be used if the caption is numbered using automatic numbering, otherwise empty. Default: `{empty}`
- number** (*tokenlist*) By default this key contains `\NoValue` which indicates that the environment is numbered using the counter `counter`, or if that is empty that no number is produced. If it holds any other value then that value is used as the “number” for the current environment and the environment counter is ignored and not stepped. Default: `\NoValue`
- title** (*tokenlist*) Fixed part of the caption, e.g., a theorem-like environment may want to specify “Lemma” here. Default: `-NoValue-`
- note** (*tokenlist*) A note, normally supplied through a mandatory argument from the document. However, it also exists as a key, so that it can alternatively be supplied in the key/val list argument of the environment. Default: `-NoValue-`
- style** (*instance*) Instance of type `thmstyle` that actually implements the theorem-like environment. Default: `plain`

Semantics & Comments: The template combines the fixed `title` and a number (if present) with the caption text as specified on the document element, if one is given, e.g., “Theorem 1. (Fermat)”. See also the `proof` template, which handles this differently.

Numbering is controlled through the keys `numbered`, `counter` and `number`. If `numbered` is `false` or if the second mandatory argument is `\BooleanTrue` (i.e., numbering was suppressed from within the document) then no numbering happens regardless of any other settings. Otherwise, if `counter` is non-empty the environment is by default numbered using that counter and the counter is automatically stepped. However, an explicit value (other than `\NoValue`) in the key `number` overwrites this: in that case the value of the `number` key is used and the counter is not stepped.

One could change the logic and allow a `number` key setting to always force this to be used.

The key name `number` could have been called `special-number`, because that is what it really is, but that is a lot to type, so I kept it short.

If the supplied mandatory argument for the note (`#3`) is not `\NoValue` it is used to overwrite the `note` key setting. This means on document-level one can add a note to a theorem-like environment in several ways:

```
\begin{axiom}[optional note]
\begin{axiom}[note={optional note},numbered=false]
```

The second variant would be necessary if other parameters are changed as well on the fly.

The bulk of the work is then outsourced to an instance of type `thmstyle`. As many such theorem-like environments share the same layout and only differ in the first caption string they use, there is this split for convenience.

For that reason the `thmstyle` templates assume that the token lists `\l_@@_title_t1`, `\l_@@_number_t1` and `\l_@@_counter` and the boolean `\l_@@_numbered_bool` have been initialized from the above keys.

decide

2.2.7 The `thmstyle` template ‘std’

Attributes:

- separator-a** (*tokenlist*) Separation to be applied between elements of the heading, typically a space command of some sort.
Default: `\_`
- separator-b** (*tokenlist*) Additional separation to be applied between elements of the heading, typically a space command of some sort. Default: `\_`
- punct** (*tokenlist*) Punctuation following the heading. Default: `.`
- caption-placement** (*choice*) Supported values `chained`, `unchained`, and `standalone`
Default: `unchained`
- caption-unbreakable** (*boolean*) Can this caption have (implicit or explicit) line breaks?
Default: `false`
- before-hspace** (*skip*) Horizontal displacement of the heading. Default: `0pt`
- after-hspace** (*skip*) Space following the heading, only relevant if text follows on the same line. Default: `5pt`
- order** (*commalist*) Order of elements in the environment caption/heading. Supported values are `title`, `number`, `punct`, `separator-a`, `separator-b`, and `note`.
Default: `title,separator-a,number,separator-b,note,punct`
- title-decls** (*tokenlist*) Declarations that are applied only to the caption title.
Default: `<empty>`
- number-decls** (*tokenlist*) Declarations that are applied only to the caption number.
Default: `<empty>`
- punct-decls** (*tokenlist*) Declarations that are applied only to the caption punctuation.
Default: `<empty>`
- note-decls** (*tokenlist*) Declarations that are applied only to the caption note.
Default: `<empty>`
- title-format** (*function1*) Formatting applied to the `title` value.
Default: `\AddPunct{#1}`
- number-format** (*function1*) Formatting applied to the `number` value. Default: `#1`
- punct-format** (*tokenlist*) Formatting applied to the `punct` value.
Default: `\AddPunct{#1}`
- note-format** (*function1*) Formatting applied to the `note` value. Default: `(#1)`
- body-decls** (*tokenlist*) Declarations that are applied to body of the environment, e.g., font settings. Default: `<empty>`

Semantics & Comments: The template assumes that the token lists `\l_@@_title_tl`, `\l_@@_number_tl` and `\l_@@_counter_tl` and the boolean `\l_@@_numbered_bool` have been initialized by the calling template.

The template makes use of the caption argument (`#3`) using it as the `note` in the `order` key processing. This is why we have the keys `note-decls` and `note-format` for customization but not a `note` key for specifying a note value.

The caption of the environment can consist of a fixed title, a number, a punctuation, some separators (typically spaces) and an optional note. Their order is defined by the key `order`. If a component is specified but has no value (or more exactly the value `\NoValue`), e.g., no note or the numbering is suppressed on individual environments, then the component and any preceding separators are ignored.

Spaces between elements are often uniform so a single `separator` may be enough, but for flexibility the template supports three distinct separators for use in the `order` key and by default uses two of them.

Alternatively, one can omit using `separator` in the `order` key and instead put all necessary spacing into the individual `...-format` keys. This approach is used, for example, if a theorem style is set up with `\newtheoremstyle` and its ninth argument contains a declaration such as

```
\thmname{#1}\thmnumber{ #2}\thmnote{ (#3)}
```

This is then translated to

```
order          = {title,number,punct,note} ,
title-format   = {#1} ,
number-format  = { #2} ,
note-format    = { (#3)} ,
```

when `\newtheoremstyle` sets up a new instance. The downside of this approach is that `\swapnumbers` would not work with such styles (because it would be necessary to transfer the space inside value for the `number-format` key to the value of `title-format`).

If you look closely at the `\newtheoremstyle`, you can see that in the generated `order` key a `punct` was added its value even though it was not explicitly present in the input. This is the way `\newtheoremstyle` worked and so we mimic that.

2.2.8 The `captionedtext` template ‘proof’

Attributes:

title (*tokenlist*) Heading for the environment unless overwritten on document level.
The default value, i.e., `\proofname` which resolves to “Proof” unless changed.
Default: `\proofname`

punct (*tokenlist*) Punctuation following the heading. Default: `.`

note (*tokenlist*) Optional note for the proof. Default: `\NoValue`

caption-placement (*choice*) Supported values `chained`, `unchained`, and `standalone`
Default: `unchained`

caption-unbreakable (*boolean*) Can this caption have (implicit or explicit) line breaks?
Default: `false`

before-hspace (*skip*) Horizontal displacement of the heading. Default: 0pt

after-hspace (*skip*) Space following the heading, only relevant if text follows on the same line. Default: 5pt

caption-decls (*tokenlist*) Declarations that are applied to the whole caption, e.g., some font settings. Default: *<empty>*

title-decls (*tokenlist*) Declarations that are applied only to the caption title. Default: *<empty>*

punct-decls (*tokenlist*) Declarations that are applied only to the caption punctuation. Default: *<empty>*

note-decls (*tokenlist*) Declarations that are applied only to the caption note. Default: *<empty>*

title-format (*function1*) Formatting applied to the **title** value. Default: #1

punct-format (*function1*) Formatting applied to the **punct** value. Default: `\AddPunct{#1}`

note-format (*function1*) Formatting applied to the **note** value. Default: #1

body-decls (*tokenlist*) Declarations that are applied to body of the environment, e.g., font settings. Default: *<empty>*

Semantics & Comments: The “unnumbered?” argument (#2) is ignored, as proofs aren’t numbered. The template makes use of the caption argument (#3) but in contrast to theorem-like environments this template replaces the **title** key value with the content of this argument (if not `\NoValue`).

Typically there is only one layout for proofs so that there is no need to split the formatting over two templates as done for theorem-like environment. That’s the reason why the template has several layout customization parameters.

3 Declaring standard display block environments and their instances

Historically the L^AT_EX kernel has defined a number of block environments directly, e.g., **center** or lists like **itemize**, but left others to be set up by document classes. For now we declare all of them here, but in the future, some (or even all) might get moved to new class files.

`\SimpleBlockEnv` Most of the standard block environments have no need for a caption, so to simplify the setup we have added the command `\SimpleBlockEnv` that hides the arguments 2–4 required by a `blockenv` instance and gives them suitable values, i.e., `\BooleanFalse\NoValue\NoValue`. This way, a document level definition for the **center** environment will look like this:

```
\NewDocumentEnvironment{center} { !0{} }
  { \SimpleBlockEnv{center}{#1} } { \BlockEnvEnd }
```

instead of the more verbose

```

\NewDocumentEnvironment{center} { !0{} }
  { \UseInstance{blockenv}{center}{#1} \BooleanFalse \NoValue \NoValue }
  { \BlockEnvEnd }

```

We use `!0{}` for the optional argument so that it is only recognized if it immediately follows `\begin{center}` without any spaces to avoid that a `[` at the start of the body text is misinterpreted as the opening bracket of the optional argument. This is only done for environments where this could be a problem.

This will then call the `center` instance of type `blockenv` that handles the rest.

`\BlockEnv` For the environments that make use of the other arguments, we offer `\BlockEnv` as syntactic sugar so that most environment declarations look similar. And we use `\BlockEnvEnd` in both cases to finish off.

```

1 <class-code>

```

In the following sections we provide for all block environments the top-level definition and all instances that are used by it. Instances of type `block` are often reused across the environments, in which case we just provide cross-references. Note that this is a design decision, different classes may want to have adjusted settings for individual environments, in which case they would provide special `block` instances instead of reusing, say, the `std-display-level` instances.

3.1 The `display` and `displayflattened` environments

`displayblock (env.)` There are two basic block environments (`displayblock` and `displayblockflattened`) which are similar to $\text{\LaTeX 2}_{\epsilon}$'s `trivlist` except that they aren't degenerated lists and thus have no hidden `\item` inside.

```

2 \NewDocumentEnvironment{displayblock}{!0{} }
3   { \SimpleBlockEnv{displayblock} {#1} } { \BlockEnvEnd }

4 \NewDocumentEnvironment{displayblockflattened}{!0{} }
5   { \SimpleBlockEnv{displayblockflattened} {#1} } { \BlockEnvEnd }

```

3.1.1 Their `blockenv` instances

`blockenv displayblock (inst.)` This is like $\text{\LaTeX 2}_{\epsilon}$'s `trivlist`, i.e., it produces a vertical block with default setting, but doesn't put a list inside but uses a `<Div>` structure.

We list all keys, those with default values, commented out.

```

6 \DeclareInstance{blockenv}{displayblock}{std}
7 {
8   name                = displayblock
9   % ,tagging-recipe    = standard
10  % ,tag-name          =
11  % ,tag-attr-class    =
12  % ,transparent-level = true
13  % ,early-legacy-code =
14  % ,late-legacy-code  =
15  % ,block-instance    = std-display
16  % ,para-instance     =
17  % ,tagging-suppress-paras = false
18  % ,inner-instance    =
19  % ,inner-instance-type = % not relevant as there is no inner instance
20  % ,inner-level-counter = % not relevant as there is no inner instance

```

```

21 % ,max-inner-levels    = 4          % not relevant as there is no inner instance
22 % ,final-code          = \ignorespaces
23 }

```

The block uses the instance `std-display` which is shown below.

`env displayblockflattened (inst.)` This flattens inner paragraphs without any surrounding tag structure by using the `basic` tagging recipe.

```

24 \DeclareInstance{blockenv}{displayblockflattened}{std}
25 {
26   name                = displayblockflattened
27   ,tagging-recipe      = basic
28   ,tagging-suppress-paras = true
29   ,transparent-level   = true
30 }

```

3.1.2 Their block instances

We provide 6 nesting levels (as in $\text{\LaTeX} 2_{\epsilon}$). If you want to provide more you need to change the `maxblocklevels` counter, offer further `std-display-⟨level⟩` instances but also define further (legacy) `\list⟨romannumeral⟩` commands for the defaults. If not, then the settings from the previous level are reused automatically—which may or may not be good enough).

```

31 \setcounter{maxblocklevels}{6}

```

`block std-display-1 (inst.)` We show all keys here for reference, with those using their default values commented out:

```

block std-display-2 (inst.) 32 \DeclareInstance{block}{std-display-1}{std}
block std-display-3 (inst.) 33 {
block std-display-4 (inst.) 34 %   ,begin-vspace      = \topsep
block std-display-5 (inst.) 35 %   ,begin-extra-vspace = \partopsep
block std-display-6 (inst.) 36 %   ,para-vspace       = \parskip
37 %   ,end-vspace        = \KeyValue{begin-vspace}
38 %   ,end-extra-vspace  = \KeyValue{begin-extra-vspace}
39 %   ,item-vspace       = \itemsep
40 %   ,begin-penalty     = \UseName{@beginparpenalty}
41 %   ,end-penalty       = \UseName{@endparpenalty}
42 %   ,left-margin       = Opt
43 %   ,right-margin      = \rightmargin
44 %   ,para-indent       = Opt
45 }
46 \DeclareInstanceCopy{block}{std-display-2}{std-display-1}
47 \DeclareInstanceCopy{block}{std-display-3}{std-display-1}
48 \DeclareInstanceCopy{block}{std-display-4}{std-display-1}
49 \DeclareInstanceCopy{block}{std-display-5}{std-display-1}
50 \DeclareInstanceCopy{block}{std-display-6}{std-display-1}

```

3.2 The center, flushleft, and flushright environments

All three environments use the `std-display` instance as block instance. They only differ in the choice of para instance.

center (*env.*) For now we redeclare various document environments as late as possible in order to make **flushleft** (*env.*) tagging work, even if classes have changed the definitions. Of course, this means that **flushright** (*env.*) such changes get lost.

```

51 \AddToHook{begindocument/before}[./legacy-core]{
52   \RenewDocumentEnvironment{center} { !0{ } }
53   { \SimpleBlockEnv{center}{#1} } { \BlockEnvEnd }
54   \RenewDocumentEnvironment{flushright} { !0{ } }
55   { \SimpleBlockEnv{flushright}{#1} } { \BlockEnvEnd }
56   \RenewDocumentEnvironment{flushleft} { !0{ } }
57   { \SimpleBlockEnv{flushleft}{#1} } { \BlockEnvEnd }
58 }

```

3.2.1 Their blockenv instances

blockenv center (*inst.*) The **center** environment is defined through the **blockenv** instance **center** which makes use of the **block** instance **std-display-⟨level⟩** and the **para** instance **center**. The block nesting level is not incremented. With respect to tagging, text separated by **\par** commands (or empty lines) inside the environment is not tagged as separate paragraphs, i.e., the whole environment is considered to be part of an outer paragraph.

```

59 \DeclareInstance{blockenv}{center}{std}{
60   name = center
61   ,tag-name =
62   ,tag-attr-class =
63   ,tagging-recipe = basic
64   ,tagging-suppress-paras = true
65   ,inner-level-counter =
66   ,transparent-level = true
67   ,early-legacy-code =
68   ,late-legacy-code =
69   ,block-instance = std-display
70   ,para-instance = center
71   ,inner-instance =
72 }

```

blockenv flushleft (*inst.*) Same as **center** except that we use the **para** instance **raggedright**.

```

\DeclareInstance{blockenv}{flushleft}{std}{
  name = flushleft
  ,tag-name =
  ,tag-attr-class =
  ,tagging-recipe = basic
  ,tagging-suppress-paras = true
  ,inner-level-counter =
  ,transparent-level = true
  ,early-legacy-code =
  ,late-legacy-code =
  ,block-instance = std-display
  ,para-instance = raggedright
  ,inner-instance =
}

```

Or more concise in the source and perhaps even faster in processing if only few keys are changed:

```

73 \DeclareInstanceCopy{blockenv}{flushleft}{center}
74 \EditInstance{blockenv}{flushleft}{
75     name           = flushleft
76     ,para-instance = raggedright }

```

`blockenv flushright` (*inst.*) Same game for flushright.

```

77 \DeclareInstanceCopy{blockenv}{flushright}{center}
78 \EditInstance{blockenv}{flushright}{
79     name           = flushright
80     ,para-instance = raggedleft }

```

3.2.2 Their block instances

They all use the block instances `std` which have already been set up in section 3.1.2.

3.2.3 Their para instances

Formatting of paragraphs is handled through the `para-instance` key which either refers to a instance of type `para` or is empty, in which case the handling of paragraphs is inherited. The predefined instances are discussed in section 4.

3.3 The quote and quotation environments

$\text{\LaTeX}2_{\epsilon}$ has two environments for quoting: `quote` and `quotation`. By default they differ only in indentation of inner paragraphs. This is handled by using separate block instances. The paragraph setup is inherited. The block nesting level is incremented.

The tag names are both role-mapped to `<BlockQuote>`.

`quote` (*env.*) We can't use `\RenewDocumentEnvironment` for `quote` and other environments that `quotation` (*env.*) are class defined, because some classes aren't implementing them at all. So we use `\DeclareDocumentEnvironment` instead. This problem will vanish if all such definitions move in new versions of the classes instead.

```

81 \AddToHook{begindocument/before}[./legacy-quotes]{
82     \DeclareDocumentEnvironment{quote}{!0}{ }
83     { \SimpleBlockEnv{quote} {#1} } { \BlockEnvEnd }

84     \DeclareDocumentEnvironment{quotation}{!0}{ }
85     { \SimpleBlockEnv{quotation} {#1} } { \BlockEnvEnd }
86 }

```

3.3.1 Their blockenv instances

`blockenv quotation` (*inst.*) For the quotation environment:

```

87 \DeclareInstance{blockenv}{quotation}{std}{
88     name           = quotation
89     ,tag-name       = \UseStructureName{block/quotation}
90     ,tag-attr-class =
91     ,tagging-recipe = standard
92     ,inner-level-counter =
93     ,transparent-level = false

```

```

94 ,early-legacy-code =
95 ,late-legacy-code =
96 ,block-instance    = quotation
97 ,inner-instance    =
98 }

```

`blockenv quote (inst.)` For the quote environment:

```

99 \DeclareInstance{blockenv}{quote}{std}{
100   name                = quote
101   ,tag-name           = \UseStructureName{block/quote}
102   ,tag-attr-class     =
103   ,tagging-recipe     = standard
104   ,inner-level-counter =
105   ,transparent-level  = false
106   ,early-legacy-code =
107   ,late-legacy-code  =
108   ,block-instance     = quote
109   ,inner-instance     =
110 }

```

3.3.2 Their block instances

`block quote-1 (inst.)` Default layout is to indent equally from both sides. Note that settings here also affect `block quote-2 (inst.)` verse as it currently reuses the block instances!

```

block quote-3 (inst.) 111 \DeclareInstance{block}{quote-1}{std}{
block quote-4 (inst.) 112   right-margin = \KeyValue{left-margin}
block quote-5 (inst.) 113   ,para-vspace = \parsep
block quote-6 (inst.) 114 }
115 \DeclareInstanceCopy{block}{quote-2}{quote-1}
116 \DeclareInstanceCopy{block}{quote-3}{quote-1}
117 \DeclareInstanceCopy{block}{quote-4}{quote-1}
118 \DeclareInstanceCopy{block}{quote-5}{quote-1}
119 \DeclareInstanceCopy{block}{quote-6}{quote-1}

```

`block quotation-1 (inst.)` Quotation additionally changes the `para-indent`.

```

block quotation-2 (inst.) 120 \DeclareInstance{block}{quotation-1}{std}
block quotation-3 (inst.) 121   { para-indent = 1.5em , right-margin = \KeyValue{left-margin} }
block quotation-4 (inst.) 122 \DeclareInstanceCopy{block}{quotation-2}{quotation-1}
block quotation-5 (inst.) 123 \DeclareInstanceCopy{block}{quotation-3}{quotation-1}
block quotation-6 (inst.) 124 \DeclareInstanceCopy{block}{quotation-4}{quotation-1}
125 \DeclareInstanceCopy{block}{quotation-5}{quotation-1}
126 \DeclareInstanceCopy{block}{quotation-6}{quotation-1}

```

3.4 The verse environment

The `verse` environment of L^AT_EX is intended for poetry. Not sure what that should mean with respect to tagging.

`verse (env.)` Implementation is like `quote` etc.

```

127 \AddToHook{begindocument/before}[./legacy]{
128   \DeclareDocumentEnvironment{verse}{!0{}}
129   { \SimpleBlockEnv{verse} {#1} } { \BlockEnvEnd }
130 }

```

3.4.1 Their blockenv instances

`blockenv verse (inst.)`

```

131 \DeclareInstance{blockenv}{verse}{std}{
132   name                = verse
133   ,tag-name            = \UseStructureName{block/verse}
134   ,tag-attr-class      =
135   ,tagging-recipe      = standard
136   ,inner-level-counter =
137   ,transparent-level   = false
138   ,early-legacy-code   =
139   ,late-legacy-code    =
140   ,block-instance      = quote          % reuse?
141   ,para-instance       = verse
142   ,inner-instance      =
143 }
```

The special indentation on continuation lines (the way L^AT_EX handled poetry) is done in the `para` instance `verse`, defined later on.

3.5 The `verbatim`, `verbatim*` and `alltt` environments

`verbatim (env.)` Here are the definitions for the `verbatim` environments. They look somewhat different
`verbatim* (env.)` than others (but this isn't the final definition). At the moment we use 2 optional arguments, the second is only there so that there is yet another scan even if one optional argument got detected. That then scans away the newline so that afterwards we can reinsert one via `\obeyedline`. A better solution will be to use a `c` specifier for grabbing the body, but that is for another day not Christmas Eve.

fix

```

144 \AddToHook{begindocument/before}[./legacy-verbatim]{
145   \RenewDocumentEnvironment{verbatim}{={late-legacy-code} !o !o }
146   { \SimpleBlockEnv{verbatim} {#1} \obeyedline } { \BlockEnvEnd }

147   \RenewDocumentEnvironment{verbatim*}{={late-legacy-code} !o !o }
148   { \SimpleBlockEnv{verbatim*} {#1} \obeyedline } { \BlockEnvEnd }
```

`alltt (env.)` The `alltt` package implements a variation on `verbatim` handling where backslash and
`alltt* (env.)` braces retain their normal meanings. We also reimplement it using the template approach
 The `alltt*` variant didn't exist in the package, but it is trivial to set it up as well.

The parsing here should be adjusted as well, eventually.

```

149 \NewDocumentEnvironment{alltt}{={late-legacy-code} !o }
150 { \SimpleBlockEnv{alltt} {#1} } { \BlockEnvEnd }
151 \NewDocumentEnvironment{alltt*}{={late-legacy-code} !o }
152 { \SimpleBlockEnv{alltt*} {#1} } { \BlockEnvEnd }
153 }
```

3.5.1 Their blockenv instances

`blockenv verbatim (inst.)` The `verbatim` environment is defined through `blockenv` instance `verbatim` that makes use of the `block` instance `verbatim-⟨level⟩` and the `para` instance `justify`. The block nesting level is not incremented. Verbatim processing requires various `\catcode` changes, etc. and as a consequence a special parsing routine that grabs the whole environment while these catcodes are in force. This setup is done in the `final-code` key and its last action is to initiate the special parsing.

```

154 \DeclareInstance{blockenv}{verbatim}{std}{
```

```

155   name                = verbatim
156   ,tag-name            = \UseStructureName{block/verbatim}
157   ,tag-attr-class      =
158   ,tagging-recipe      = standard
159   ,tagging-suppress-paras = true
160   ,inner-level-counter =
161   ,transparent-level   = true
162   ,early-legacy-code   =
163   ,late-legacy-code    =
164   ,block-instance      = verbatim
165   ,inner-instance      =
166   ,para-instance       = justify

```

Here is where `verbatim` and `verbatim*` technically differ: in the former we set up spaces to become nonbreakable spaces (if necessary followed by a `\pdfspacespace` in the pdfTeX engine) and in `verbatim*` we set it up to generate visible space chars.

```

167   ,final-code          = \legacyverbatimsetup{invisible}

```

Then we start the special scanning process to look for `\end{verbatim}` with special catcodes and grab everything in between. For `verbatim*` we use `\@sxverbatim` to look for `\end{verbatim*}` instead.¹

```

168                               \@sxverbatim
169   }

```

The role-mapping is `<verbatim>` to `<Code>` and `<codeline>` to `<Sub>` (which is role mapped to `<Span>` in pdf 1.7). Sub inside Code is allowed according the errata of ISO 32005. The paragraphs inside `verbatim` are flattened. Line numbers should be inside the `<codeline>` structure and be tagged either as `<Lb1>` or `<Artifact><Lb1>`.

`blockenv verbatim* (inst.)` The implementation of `verbatim*` is similar using the `blockenv` instance `verbatim*`. Its `final-code` sets up visible spaces and a slightly different parsing that grabs everything up to `\end{verbatim*}`. Otherwise the setup is identical.

```

170 \DeclareInstance{blockenv}{verbatim*}{std}{
171   name                = verbatim
172   ,tag-name            = \UseStructureName{block/verbatim}
173   ,tag-attr-class      =
174   ,tagging-recipe      = standard
175   ,tagging-suppress-paras = true
176   ,inner-level-counter =
177   ,transparent-level   = true
178   ,early-legacy-code   =
179   ,late-legacy-code    =
180   ,block-instance      = verbatim
181   ,inner-instance      =
182   ,para-instance       = justify
183   ,final-code          = \legacyverbatimsetup{visible}
184                       \@sxverbatim
185 }

```

`blockenv alltt (inst.)` The implementation of the `alltt` environment from the `alltt` is more or less identical as well. We just need a slightly different final code to keep backslash and braces functional.

```

186 \DeclareInstance{blockenv}{alltt}{std}{

```

¹Perhaps there should be some other command names for this?

private tag instead?

```
187     name                = alltt
188     ,tag-name            = \UseStructureName{block/verbatim}
189     ,tag-attr-class      =
190     ,tagging-recipe      = standard
191     ,tagging-suppress-paras = true
192     ,inner-level-counter =
193     ,transparent-level   = true
194     ,early-legacy-code   =
195     ,late-legacy-code    =
196     ,block-instance      = verbatim
197     ,inner-instance      =
198     ,para-instance       = justify
```

Now set up the special environment settings with most characters verbatim. We don't even have to scan ahead for the `\end{alltt}` because backslash and braces still have their normal meaning.

```
199     ,final-code         = \legacyallttsetup {invisible}
200 }
```

`blockenv alltt* (inst.)` The `alltt*` variant didn't exist in the `alltt` package, but it is trivial to set it up as well.

private tag instead?

```
201 \DeclareInstance{blockenv}{alltt*}{std}{
202     name                = alltt*
203     ,tag-name            = \UseStructureName{block/verbatim}
204     ,tag-attr-class      =
205     ,tagging-recipe      = standard
206     ,tagging-suppress-paras = true
207     ,inner-level-counter =
208     ,transparent-level   = true
209     ,early-legacy-code   =
210     ,late-legacy-code    =
211     ,block-instance      = verbatim
212     ,inner-instance      =
213     ,para-instance       = justify
214     ,final-code         = \legacyallttsetup {visible}
215 }
```

3.5.2 Their block instances

`block verbatim-1 (inst.)` Verbatim instances have their own levels so that one can specify specific indentations or vertical separations between lines.

```
block verbatim-3 (inst.) 216 \DeclareInstance{block}{verbatim-1}{std} {
block verbatim-4 (inst.) 217     ,left-margin      = Opt
block verbatim-5 (inst.) 218     ,para-vspace     = Opt
block verbatim-6 (inst.) 219 }

220 \DeclareInstanceCopy{block}{verbatim-2}{verbatim-1}
221 \DeclareInstanceCopy{block}{verbatim-3}{verbatim-1}
222 \DeclareInstanceCopy{block}{verbatim-4}{verbatim-1}
223 \DeclareInstanceCopy{block}{verbatim-5}{verbatim-1}
224 \DeclareInstanceCopy{block}{verbatim-6}{verbatim-1}
```

3.6 The standard lists: `itemize`, `enumerate`, and `description`

`itemize` (*env.*) For the standard lists everything is managed by the `blockenv` instances. For the list we
`enumerate` (*env.*) do not require that the optional argument directly follows without spaces as there can be
`description` (*env.*) no conflict with any following text (only `\item` or an empty line or the optional argument
would be possible).

```

225 \AddToHook{begindocument/before}[./legacy-lists]{
226   \RenewDocumentEnvironment{itemize}{0}{ }
227   { \SimpleBlockEnv{itemize} {#1} } { \BlockEnvEnd }

228   \RenewDocumentEnvironment{enumerate}{0}{ }
229   { \SimpleBlockEnv{enumerate} {#1} } { \BlockEnvEnd }

230   \DeclareDocumentEnvironment{description}{0}{ }
231   { \SimpleBlockEnv{description} {#1} } { \BlockEnvEnd }
232 }
```

3.6.1 Their `blockenv` instances

`blockenv itemize` (*inst.*) The `itemize` environment is defined through the `blockenv` instance `itemize` which makes use of the block instance `list-⟨level⟩`, and an inner instance `itemize-⟨inner-level⟩` of type `list`. The paragraph setup is inherited.² The `⟨inner-level⟩` is determined through `\@itemdepth`. The block nesting level and the inner list nesting level are incremented.

```

233 \DeclareInstance{blockenv}{itemize}{std}{
234   name = itemize
235   ,tag-name = \UseStructureName{block/itemize}
236   ,tag-attr-class = itemize
237   ,tagging-recipe = list
238   ,inner-level-counter = \@itemdepth
239   ,transparent-level = false
240   ,max-inner-levels = 4
241   ,early-legacy-code =
242   ,late-legacy-code =
243   ,block-instance = std-list
244   ,inner-instance-type = list
245   ,inner-instance = itemize
246   ,para-instance =
247 }
```

`blockenv enumerate` (*inst.*) The `enumerate` environment is similar to `itemize` but uses the `blockenv` instance `enumerate`, the block instance `list-⟨level⟩`, and the inner instance `enumerate-⟨inner-level⟩`. The `⟨inner-level⟩` is determined through `\@enumdepth`.

```

248 \DeclareInstance{blockenv}{enumerate}{std}{
249   name = enumerate
250   ,tag-name = \UseStructureName{block/enumerate}
251   ,tag-attr-class = enumerate
252   ,tagging-recipe = list
253   ,transparent-level = false
254   ,max-inner-levels = 4
```

²In the L^AT_EX 2_ε implementation justified paragraphs were forced, even if the whole document was set in ragged text. If this slightly strange behavior is desired then one has to set the `para-instance` key to `justify`.

```

255 ,early-legacy-code =
256 ,late-legacy-code  =
257 ,early-legacy-code =
258 ,block-instance    = std-list
259 ,inner-level-counter = \@enumdepth
260 ,inner-instance-type = list
261 ,inner-instance     = enumerate
262 }

```

`blockenv description (inst.)` The `description` environment uses the `blockenv` instance `description`, the block instance `list-⟨level⟩`, and the inner instance `description`.

In L^AT_EX 2_ε that was no dependency on the nesting level, i.e., the environment has the same appearance on all nesting levels, but there is actually no good reason for disallowing layout adjustments on each level. All we have to do for this is to provide a value `inner-level-counter` and allocate a counter register for that.

We allow for 6 levels.

```

263 \DeclareInstance{blockenv}{description}{std}{
264   name = description
265   ,tag-name = \UseStructureName{block/description}
266   ,tag-attr-class = description
267   ,tagging-recipe = list
268   ,inner-level-counter = \@descriptiondepth
269   ,transparent-level = false
270   ,max-inner-levels = 6
271   ,early-legacy-code =
272   ,late-legacy-code =
273   ,block-instance = std-list
274   ,inner-instance-type = list
275   ,inner-instance = description
276 }

```

`\@descriptiondepth` Counting nested `description` environments.

```

277 \newcount\@descriptiondepth

```

(End of definition for \@descriptiondepth. This function is documented on page ??.)

3.6.2 Their block instances

`block std-list-1 (inst.)` The block instances for the various list environments use the same underlying instance `block std-list-2 (inst.)` (well, by default) and nothing needs to be set up specifically (because that is already done in the legacy `\list⟨romannumeral⟩` unless a different layout is wanted).

```

278 \DeclareInstance{block}{std-list-1}{std}{
279 %   begin-vspace = \topsep
280 %   ,begin-extra-vspace = \partopsep

```

This is the only one we have to explicitly set for lists if the default setup is wanted.

```

281 ,para-vspace = \parsep

```

Everything else uses the template defaults.

```

282 %   ,end-vspace = \KeyValue{begin-vspace}
283 %   ,end-extra-vspace = \KeyValue{begin-extra-vspace}
284 %   ,item-vspace = \itemsep
285 %   ,begin-penalty = \UseName{@beginparpenalty}

```

```

286 % ,end-penalty      = \UseName{@endparpenalty}
287 % ,left-margin      = \leftmargin
288 % ,right-margin     = \rightmargin
289 % ,para-indent      = 0pt
290 }

291 \DeclareInstanceCopy{block}{std-list-2}{std-list-1}
292 \DeclareInstanceCopy{block}{std-list-3}{std-list-2}
293 \DeclareInstanceCopy{block}{std-list-4}{std-list-3}
294 \DeclareInstanceCopy{block}{std-list-5}{std-list-4}
295 \DeclareInstanceCopy{block}{std-list-6}{std-list-5}

```

If the legacy `\list<romannumeral>` is not used in a modern class then, of course, these instances all need to set up the different parameters explicitly. The new implementation of the standard classes (will) show that approach.

3.6.3 Their list instances

For all list instances we have to say what kind of label we want (`item-label`) and how it should be formatted.

`list itemize-1 (inst.)` For `itemize` environments this is all we need to do and we refer back to the external definitions rather than defining the `item-label` code in the instance to ensure that old documents still work.

```

list itemize-2 (inst.)
list itemize-3 (inst.)
list itemize-4 (inst.)
296 \DeclareInstance{list}{itemize-1}{std}{ item-label = \labelitemi }
297 \DeclareInstance{list}{itemize-2}{std}{ item-label = \labelitemii }
298 \DeclareInstance{list}{itemize-3}{std}{ item-label = \labelitemiii }
299 \DeclareInstance{list}{itemize-4}{std}{ item-label = \labelitemiv }

```

`list enumerate-1 (inst.)` The `enumerate` environments are similar, except that we also have to say which counter to use on each level.

```

list enumerate-2 (inst.)
list enumerate-3 (inst.)
list enumerate-4 (inst.)
300 \DeclareInstance{list}{enumerate-1}{std}
301 { item-label = \labelenumi , counter = enumi }
302 \DeclareInstance{list}{enumerate-2}{std}
303 { item-label = \labelenumii , counter = enumii }
304 \DeclareInstance{list}{enumerate-3}{std}
305 { item-label = \labelenumiii , counter = enumiii }
306 \DeclareInstance{list}{enumerate-4}{std}
307 { item-label = \labelenumiv , counter = enumiv }

```

`list description (inst.)` In $\text{\LaTeX} 2_{\epsilon}$ the `description` lists used only a single list instance with only one key not using the default. But in this implementation we allow for customization of every level, even though we aren't making use of it by default.

Doing that means that you can only use a limited number of nested environments (while in $\text{\LaTeX} 2_{\epsilon}$ one could have arbitrary nesting, so let's hope 6 levels are enough.

TODO: consider reusing the last level if you run out of specified levels rather than using `max-inner-levels`.

```

308 \DeclareInstance{list}{description-1}{std} { item-instance = description }

309 \DeclareInstanceCopy{list}{description-2}{description-1}
310 \DeclareInstanceCopy{list}{description-3}{description-1}
311 \DeclareInstanceCopy{list}{description-4}{description-1}
312 \DeclareInstanceCopy{list}{description-5}{description-1}
313 \DeclareInstanceCopy{list}{description-6}{description-1}

```

3.6.4 Their item instances

`item basic (inst.)` There are two item instances to set up: `description` for use with the `description` environment and `basic` for use with all other lists (up to now).

```

314 \DeclareInstance{item}{basic}{std}{
315   {
316     label-align = right,
317     label-ref=\def\@currentlabel{#1}\def\@currentlabelname{#1}
318   }

319 \DeclareInstance{item}{description}{std}{
320   ,label-format = \normalfont\bfseries #1
321   ,label-align = left
322   ,label-ref=\def\@currentlabel{#1}\def\@currentlabelname{#1}
323 }
```

3.7 The legacy list and trivlist environments

In $\text{\LaTeX 2}_\epsilon$, `trivlist` was used to define various display environments that aren't really lists at all. To support such legacy definitions (even though they should be updated to achieve proper tagging) we continue to support and implement it as a `list` environment with a few hardwired settings mimicking the original behavior.

maybe we should simply implement it as a `displayblock` instance (at least when doing tagging) - decide

The legacy 2 ϵ list environment is more complicated as we have to get the extra arguments accounted for.

```

324 \AddToHook{begindocument/before}[./legacy]{
325   \RenewDocumentEnvironment{list}{0}{m m }
326   {
```

We do this by storing them away and then call the list instance. Inside this instance the `early-legacy-code` key contains `\legacylistsetup` which makes use of the stored values.

```

327   \tl_set:Nn \l_@@_legacy_env_params_tl
328   {
329     \tl_set:Nn \@itemlabel {#2}
330     #3
331   }
```

The $\text{\LaTeX 2}_\epsilon$ lists don't support captions so we use `\SimpleBlockEnv`.

```

332   \SimpleBlockEnv{list} {#1}
333   }
334   { \BlockEnvEnd }
335 }
```

`trivlist (env.)` $\text{\LaTeX 2}_\epsilon$ defined `trivlist` as an implementation of `list` (or rather the other way around).

Replace with code not using `\list`

```

336 \AddToHook{begindocument/before}[./legacy]{
337   \RenewDocumentEnvironment{trivlist}{!0{} }
338   { \list{#1}{
339     {
340       \dim_zero:N \leftmargin
341       \dim_zero:N \labelwidth
342       \cs_set_eq:NN \makelabel \use:n
```

```

343         }
344     }
345     { \BlockEnvEnd }
346 }

```

3.7.1 Its `blockenv` instance

`blockenv list` (*inst.*) The generic `list` environment of $\text{\LaTeX} 2_{\epsilon}$ is modeled with a `blockenv` instance named `list`, a `block` instance named `std-list- $\langle level \rangle$` , and an inner instance named `legacy` (with no dependency on the nesting level). This environment has two arguments and customization of the layout is expected to be directly set in the second argument. For this reason this `legacy` instance is something that shouldn't be changed (all that is attempted to provide a way to support legacy setups).

To set up the default settings (as they were used in $\text{\LaTeX} 2_{\epsilon}$) the `early-legacy-code` key gets `\legacylistsetup` assigned that contains the necessary code to set up these defaults. Changing the `blockenv` is therefore not recommended for the `legacy list` environment.

```

347 \DeclareInstance{blockenv}{list}{std}{
348     name                = list
349     ,tag-name            = \UseStructureName{block/list}
350     ,tag-attr-class      =
351     ,tagging-recipe      = list
352     ,transparent-level   = false
353     ,early-legacy-code   = \legacylistsetup
354     ,late-legacy-code    =
355     ,block-instance      = std-list
356     ,inner-level-counter =
357     ,inner-instance-type = list
358     ,inner-instance      = legacy
359 }

```

3.7.2 Its `list` instance

`list legacy` (*inst.*) For the `legacy list` environment there is only one instance which is reused on all levels. This is done this way because the `legacy list` environment sets all its parameters through its arguments. So this instances shouldn't really be touched. It sets the `legacy-support` key to true, which means that the `list` code uses `\makelabel` for formatting the label.

```

360 \DeclareInstance{list}{legacy}{std}{
361     ,item-instance = basic
362     ,legacy-support = true
363 }

```

3.8 Theorem-like environments declared through `\newtheorem`

In standard $\text{\LaTeX}$ theorem-like environments are not defined directly, but with the help of a `\newtheorem` declaration. That allows specifying the typeset environment title, e.g., “Lemma”, and the counter to use to number the environments, e.g., they could be all numbered individually or one could number them using the same counter as some other theorem-like environment.

This was first augmented by the `theorem` package which implemented the idea of a `\theoremstyle`; this is now considered obsolete. Michael Downes from the AMS

improved on these early ideas and wrote the `amsthm` package, which offered more functionality including a `\newtheoremstyle` declaration and for the document level a `\swapnumbers` and an `proof` environment. It also provided star-forms for `\newtheorem` (to define an unnumbered environment) and allowed to use star-forms of the theorem-like environments to suppress numbering on an individual instance in the document.

This new implementation based on templates, is supposed to cover the functionality of `amsthm` including its declarations so that documents that use `amsthm` explicitly or implicitly via their class should continue to work seamlessly.

For other packages that provide theorem-like environments we have to see if they could be easily remodeled using the new implementation or if there is a need for extended templates.

Assuming declarations such as

```
% \swapnumbers           % <- commented out
\theoremstyle{definition}
\newtheorem{axiom}[def]{Axiom}
```

in a document, then the following instances of type `blockenv` and `captionedtext` are declared by `\newtheorem`.

3.8.1 The `blockenv` instances they use

Given the above input `\newtheorem` defines the following `blockenv` instance:

```
\DeclareInstance{blockenv}{axiom}{std}{
  name                = theorem-like
  ,tag-name            = \UseStructureName{block/theorem-like}
  ,tagging-recipe      = standalone
  ,standalone          = true
  ,transparent-level   = true
  ,block-instance:e    = thm-
                        \IfInstanceExistsTF{block}
                        { thm-definition-1 }
                        { definition } { plain }
  ,inner-instance-type = captionedtext
  ,inner-instance      = axiom
  ,para-instance       = justify
}
```

The setting for `block-instance` means that it checks if a `block` instance with the name `thm-definition-1` exists. If so then the value `thm-definition` is used, otherwise `thm-plain` is used which is always defined, i.e., if the `theoremstyle` does not specify any special vertical spacing the `block` instance from the `plain` style is reused.

What varies from `blockenv` instance to instance are the values for `block-instance` and `inner-instance`.

We use `<theorem-like>` as the structure name and role-map it to a `<Sect>` because that can hold a `<Caption>`.

3.8.2 The captionedtext instances they use

The instance of type `captionedtext` is also defined by `\newtheorem` and in this case it looks like this:

```
\DeclareInstance{captionedtext}{axiom}{thmlike}{
  numbered = true
  ,counter = def
  ,title    = Axiom          % <-- that the title provided to \newtheorem
  ,number   = \NoValue       % <-- for special one-off settings
  ,note     = \NoValue       % <-- value normally document supplied
  ,style    = definition     % <-- that's the used \theoremstyle
}
```

The `number` key should really be called `special-number` as all it does when set to a real value is to overwrite the automatic numbering and force its value as the current number, i.e., enables a one-off overwrite of the number from within the document.

If we uncomment the `\swapnumbers` line in the example above then we get

```
,style    = definition-swap
```

in the `captionedtext` instance instead.

3.8.3 The thmstyle instances they use

New theorem styles can be declared with `\newtheoremstyle` which then generates an instance of type `thmstyle`. Alternatively, it is, of course, possible to declare the instances directly (which gives you a bit more flexibility). A few such styles are predeclared, matching what is offered by `amsthm`. These are shown below.

`thmstyle plain (inst.)` The main style used for many theorem-like environments, i.e., the one you get if no special `\theoremstyle` has been specified.

```
364 \DeclareInstance{thmstyle}{plain}{std}{
365   ,caption-placement = unchained
366   ,separator-a       = \
367   ,separator-b       = \
368   ,punct             = .
369   ,before-hspace     = 0pt
370   ,after-hspace      = 5pt plus 1pt minus 1pt
371   ,order              = {title,separator-a,number,separator-b,note,punct}
372   ,caption-decls      = \bfseries
373   ,title-decls        =
374   ,number-decls       = \upshape
375   ,punct-decls        =
376   ,note-decls         = \upshape\mdseries
377   ,title-format       = #1
378   ,number-format      = #1
379   ,punct-format       = \AddPunct{#1}
380   ,note-format        = (#1)
381   ,body-decls         = \itshape
382 }
```

`thmstyle remark` (*inst.*) The remark is like plain with two changes:

```

383 \DeclareInstanceCopy{thmstyle}{remark}{plain}
384 \EditInstance{thmstyle}{remark}{
385   ,caption-decls = \itshape
386   ,body-decls    = \normalfont
387 }

```

`thmstyle definition` (*inst.*) The definition is like plain with only a difference in the font used for the body:

```

388 \DeclareInstanceCopy{thmstyle}{definition}{plain}
389 \EditInstance{thmstyle}{definition}{
390   ,body-decls = \normalfont
391 }

```

`thmstyle legacy2e` (*inst.*) Vanilla L^AT_EX 2_ε (without `amsthm` loaded) had a slightly different default. We provide this under the name `legacy2e`. It doesn't use a punctuation after the number and it has slightly different vertical spacing (defined by `thm-legacy2e-1` below).

Thus, to reprocess an old document for tagging that uses `\newtheorem` without loading `amsthm` one has to set `\theoremstyle{legacy2e}` to avoid layout changes. How such a compatibility setting is automated is not yet decided.

```

392 \DeclareInstanceCopy{thmstyle}{legacy2e}{plain}
393 \EditInstance{thmstyle}{legacy2e}{ punct = }

```

3.8.4 The block instances they use

`block thm-plain-1` (*inst.*) Theorems do not support nesting, so in theory we have to set up only one. There are, however, documents that put theorem-like environments inside of lists or other block environments. While that is in most cases somewhat dubious, it can make sense, for example, in `description` lists. So we support it by providing `thm-plain` instances for levels 1 and 2. If somebody really nests them further down, then more such instances need to be declared.

The L^AT_EX default reused the general value of `\parindent` and `\parskip` and, of course, they start at the outer margin.

```

394 \DeclareInstance{block}{thm-plain-1}{std}{
395   ,begin-extra-vspace = 0pt
396   ,left-margin        = 0pt
397   ,para-indent        = \parindent
398   ,para-vspace        = \parskip
399 }
400 \DeclareInstanceCopy{block}{thm-plain-2}{thm-plain-1}

```

`block thm-remark-1` (*inst.*) The `\thmstyle` for “remarks” is defined by `amsthm` to use less vertical spacing. It therefore needs its own block instance.

```

401 \DeclareInstance{block}{thm-remark-1}{std}{
402   ,begin-vspace        = 0.5\topsep
403   ,begin-extra-vspace = 0pt
404   ,left-margin        = 0pt
405   ,para-indent        = \parindent
406   ,para-vspace        = \parskip
407 }
408 \DeclareInstanceCopy{block}{thm-remark-2}{thm-remark-1}

```

`block thm-definition-1 (inst.)` The `\thmstyle` for “definitions” uses the same settings as the `plain` instances, so those
`block thm-definition-2 (inst.)` could be reused. However, to make it easy to customize the styles individually we provided
named instances.

```
409 \DeclareInstanceCopy{block}{thm-definition-1}{thm-plain-1}
410 \DeclareInstanceCopy{block}{thm-definition-2}{thm-definition-1}
```

`block thm-legacy2e-1 (inst.)` These are like the `plain` ones but without resetting `begin-extra-vspace` to zero.

```
block thm-legacy2e-2 (inst.) 411 \DeclareInstance{block}{thm-legacy2e-1}{std}{
412   ,left-margin           = Opt
413   ,para-indent           = \parindent
414   ,para-vspace           = \parskip
415 }
416 \DeclareInstanceCopy{block}{thm-legacy2e-2}{thm-legacy2e-1}
```

3.9 The proof environment (from `amsthm`)

`proof (env.)` The `proof` environment expects one optional argument holding an alternative title for the proof. We parse this optional argument as an implicit key/value argument, so that it is possible to interpret it either as the value for the key `note` or as a key/value list that holds special key settings for this particular environment instance. The result is analyzed by `\ParseLaTeXeTheoremlike` which then calls a `blockenv` instance with the name `proof`.

In addition we have to set up handling of QED symbols using `\pushQED` and `\popQED` using the logic already defined in `amsthm`. Details on all this is given in the code section of this module but normally this top-level declaration doesn’t require any changes. Conceptually, it would be better to disallow spaces before the optional argument here. But `amsthm` never did this, so for compatibility we aren’t doing this either.

```
417 \NewDocumentEnvironment{proof}{={optarg}o }
418 { \pushQED{\qed}
419   \ParseLaTeXeTheoremlike {proof} \BooleanTrue {#1} }
420 { \popQED \BlockEnvEnd }
```

`blockenv proof (inst.)` A `proof` uses its own `proof` instance of type `block` for vertical spacing. As the `proof` has a heading we use a `captionedtext` instance with name `proof` as the inner instance and the paragraphs of the `proof` are justified.

```
421 \DeclareInstance{blockenv}{proof}{std}{
422   name                 = proof
423   ,tag-name             = \UseStructureName{block/proof}
424   ,tag-attr-class       =
425   ,tagging-recipe       = standalone
426   ,standalone           = true
427   ,inner-level-counter  =
428   ,transparent-level    = true
429   ,early-legacy-code   =
430   ,late-legacy-code    =
431   ,block-instance       = proof
432   ,inner-instance-type  = captionedtext
433   ,inner-instance       = proof
434   ,para-instance        = justify
435 }
```

`captionedtext proof` (*inst.*) We use a special `captionedtext` template to set up the proof because proofs are not numbered and the argument to a proof environment has a somewhat different semantic meaning than that of theorem-like environments.

If the title ends in a punctuation we should not add an additional one, thus we add it with `\AddPunct`.

```

436 \DeclareInstance{captionedtext}{proof}{proof}{
437   ,title           = \proofname           % default value
438   ,punct           = .
439   ,before-hspace   = 0pt
440   ,after-hspace    = 5pt plus 1pt minus 1pt
441   ,caption-decls   = \itshape
442   ,title-format    = #1
443   ,punct-format    = \AddPunct{#1}
444   ,body-decls      = \normalfont
445 }
```

3.9.1 Block instances for the proofs

`block proof-1` (*inst.*) Blocks for proofs are pretty normal (the values are taken from the `amsthm` implementation):

```

446 \DeclareInstance{block}{proof-1}{std}{
447   ,begin-vspace    = 6pt plus 6pt
448   ,left-margin     = 0pt
449   ,para-indent     = \parindent
450   ,para-vspace     = \parskip
451 }
452 \DeclareInstanceCopy{block}{proof-2}{proof-1}
```

4 Declaring para instances

Display block environments often require special paragraph settings and therefore have a `para-instance` key to specify and appropriate instance. Here are the standard instances that are predefined for this purpose.

`para justify` (*inst.*) Justifying is exactly what the default values do, so the instance hasn't any special setup.

```

453 \DeclareInstance{para}{justify}{std}{
454   % ,para-attr-class    = justify
455   % ,para-indent       = \parindent
456   % ,begin-hspace      = 0pt
457   % ,left-hspace       = \z@skip
458   % ,right-hspace      = \z@skip
459   % ,end-hspace        = \@flushglue
460   % ,final-hyphen-demerits = 5000
461   % ,newline-cmd       = \@normalcr
462 }
```

`para center` (*inst.*) Centering a paragraph means putting stretchable glue on both sides.

```

463 \DeclareInstance{para}{center}{std}{
464   ,para-attr-class    = center
465   ,para-indent       = 0pt
466   % ,begin-hspace     = 0pt
```

```

467 ,left-hspace          = \@flushglue
468 ,right-hspace         = \@flushglue
469 ,end-hspace           = \z@skip
470 ,final-hyphen-demerits = 0
471 ,newline-cmd          = \@centercr
472 }

```

`para raggedright` (*inst.*) This is the plain $\text{\TeX}$ version of ragged right, which basically means no hyphenation unless a word is truly longer than a line. This implements `flushleft`.

```

473 \DeclareInstance{para}{raggedright}{std}{
474   ,para-attr-class      = raggedright
475   ,para-indent          = Opt
476   % ,begin-hspace       = Opt
477   ,left-hspace          = \z@skip
478   ,right-hspace         = \@flushglue
479   ,end-hspace           = \parfillskip
480   ,final-hyphen-demerits = 0
481   ,newline-cmd          = \@centercr
482 }

```

`para raggedleft` (*inst.*) This here is for `flushright`.

```

483 \DeclareInstance{para}{raggedleft}{std}{
484   ,para-attr-class      = raggedleft
485   ,para-indent          = Opt
486   % ,begin-hspace       = Opt
487   ,left-hspace          = \@flushglue
488   ,right-hspace         = \z@skip
489   ,end-hspace           = \z@skip
490   ,final-hyphen-demerits = 0
491   ,newline-cmd          = \@centercr
492 }

```

`\centering` These instances are also used to implement declarations for direct use in documents or in user definitions.

```

\raggedleft
\raggedright
\justifying
493 \DeclareRobustCommand\centering {\UseInstance{para}{center}{}}
494 \DeclareRobustCommand\raggedleft {\UseInstance{para}{raggedleft}{}}
495 \DeclareRobustCommand\raggedright{\UseInstance{para}{raggedright}{}}
496 \DeclareRobustCommand\justifying {\UseInstance{para}{justify}{}}

```

$\text{\LaTeX}$'s default is to typeset paragraphs justified.

```

497 \justifying

```

(End of definition for `\centering` and others.)

`para verse` (*inst.*) For the `verse` environment we use a special `para` instance. If the right hand side should be ragged then a different `right-hspace` is needed.

```

498 \DeclareInstance{para}{verse}{std}{
499   para-attr-class      = justify ,
500   para-indent          = Opt ,
501   begin-hspace         = -1.5em ,
502   left-hspace          = 1.5em ,
503   right-hspace         = Opt ,
504   end-hspace           = \@flushglue ,
505   final-hyphen-demerits = 0 ,

```

```

506     newline-cmd           = \@centercr ,
507 }
508 \</class-code>

```

5 Advice on adjusting the layout of standard block environments

to document

6 Tagging support

6.1 Paragraph tags

Paragraphs in L^AT_EX can be nested, e.g., you can have a paragraph containing a display quote, which in turn consists of more than one (sub)paragraph, followed by some more text which all belongs to the same outer paragraph.

In the PDF model and in the HTML model that is not supported — a limitation that conflicts with real life, given that such constructs are quite normal in spoken and written language.

The approach we take to resolve this is to model such “big” paragraphs with a structure named `<semantic-para>` and use `<text-block>` (role-mapped to `<P>`) only for (portions of) the actual paragraph text in a way that the `<text-block>`s are not nested. As a result we have for a simple paragraph the structures

```

<text-block>
  <text-block>
    The paragraph text ...
  </text-block>
</text-block>

```

The `<semantic-para>` structure is role-mapped to `<Part>` or possibly to `<Div>` so we get a valid PDF, but processors who care can identify the complete paragraphs by looking for `<semantic-para>` tags.

In the case of an element, such as a display quote or a display list inside the paragraph, we then have

```

<semantic-para>
  <text-block>
    The paragraph text before the display element ...
  </text-block>
  <display element structure>
    Content of the display structure possibly involving inner <semantic-para> tags
  </display element structure>
  <text-block>
    ... continuing the outer paragraph text
  </text-block>
</semantic-para>

```

In other words such a display block is always embedded in a `<semantic-para>` structure, possibly preceded by a `<text-block>...</text-block>` block and possibly followed by one, though both such blocks are optional.

Thus an `itemize` environment that has some introductory text but no text immediately following the list would be tagged as follows:

```
<semantic-para>
  <text-block>
    The intro text for the itemize environment ...
  </text-block>
  <itemize>
    <LI>
      <itemlabel> label </itemlabel>
      <itembody>
        The text of the first item involving <semantic-para> as necessary ...
      </itembody>
    </LI>
    <LI>
      The second item ...
    </LI>
    ... further items ...
  </itemize>
</semantic-para>
```

The `<itemize>` is role-mapped to `<L>`.

For some display blocks, such as centered text, we use a simpler strategy. Such blocks still ensure that they are inside a `<semantic-para>` structure but their body uses simple `<text-block>` blocks and not `<semantic-para><text-block>` inside, e.g., the input

```
This is a paragraph with some
\begin{center}
  centered lines

  with a paragraph break between them
\end{center}
followed by some more text.
```

will be tagged as follows:

```
<semantic-para>
  <text-block>
    This is a paragraph with some
  </text-block>
  <text /0 /Layout /TextAlign/Center>
    centered lines
  </text-block>
  <text /0 /Layout /TextAlign/Center>
    with a paragraph break between them
  </text-block>
```

```

    <text-block>
      followed by some more text.
</semantic-para>

```

The semantic-para structures are added by using the tagging sockets `para/semantic/begin` and `para/semantic/end` declared in `ltagging.dtx`. They can be disabled by assigning these sockets the plug `noop`.

6.1.1 Tagging recipes

There are a number of different tagging recipes that implement different tagging approaches. They are selected through the `tagging-recipe` of the `blockenv` template. Currently the following values are implemented:

noop This recipe does not add tagging structures and also does not set the endpe switch. The recipe is meant for environments like `adjustwidth` that only want to change the layout, and which can contain, e.g., sectioning commands.

standalone This recipe does the following:

- Ensure that the `blockenv` is not inside a `<semantic-para>` structure. If necessary, close the open one (and any open `<text-block>` structure).
- Text inside the body of the environment start with `<semantic-para><text-block>` unless the key `tagging-suppress-paras` is set to `true` (which is most likely the wrong thing to do because we then get just `<text-block>` as the structure).
- At the end of the environment close `</text-block>` and possibly an inner `</semantic-para>` if open.
- Finally, ensure that after the environment a new `<semantic-para>` is started, if appropriate, e.g., if text is following.

basic This recipe does the following:

- Ensure that the `blockenv` is inside a `<semantic-para>` structure, if necessary, start one.
- If inside a `<semantic-para><text-block>`, then close the `</text-block>` but leave the `<semantic-para>` open.
- Text inside the body of the environment start with `<semantic-para><text-block>` if `tagging-suppress-paras` is set to `false`, otherwise just with `<text-block>`.
- At the end of the environment close `</text-block>` and possibly an inner `</semantic-para>` if open.
- Then look if the environment is followed by an empty line (`\par`). If so, close the outer `</semantic-para>` and start any following text with `<semantic-para><text-block>`. Otherwise, don't and following text restarts with a just a `<text-block>` (and no paragraph indentation)

standard This recipe is like the `basic` one as far as handling `<semantic-para>` and `<text-block>` is concerned. In addition

- it starts an inner tagging structure (i.e., which is therefore a child of the outer `<semantic-para>`).
- By default this structure is a `<Div>` unless overwritten by the key `tag-name`. If that key is used, a suitable role-map needs to be provided for the name given.
- At the end of the environment that inner structure is closed again so that we are back on the `<semantic-para>` level from the outside.
- Then the lookahead for an empty line is done as described previously.

list This recipe is like the **standard** one except that

- the inner structure is a list (`<L>`).
- Furthermore everything is set up so that we have list items (`<LI>`) with suitable substructures (`<itemlabel>` for the item labels and `<itembody>` for the item bodies).
- If the key `tag-name` is specified, this is used as the tag name for the whole list instead of `<L>`. Of course, it should then have a suitable role-map.
- If the key `tag-attr-class` is specified then this is used as the class attribute. Again, this requires a suitable setup on the outside.
- At the end of the environment the `</itembody>`, `</LI>`, and `</L>` (or the tag name used) are closed.
- Then the lookahead for an empty line is done as described previously.

7 Tracing and debugging

```
\DebugBlocksOn
\DebugBlocksOff
\block_debug_on:
\block_debug_off:
```

These commands enable/disable debugging messages for blocks. They also enable/disable debugging of templates (e.g., call `\DebugTemplatesOn` or `\DebugTemplatesOff`).

The data that is produced is rather verbose and largely guided (so far) by what seemed helpful while developing the code. This needs some cleanup at a later stage. At the moment, if you have the following simple document

```
1      \DocumentMetadata{tagging=on, lang=en}
2
3      \documentclass{article}
4
5      \DebugBlocksOn
6
7      \begin{document}
8        \begin{itemize}[item-viewport=3pt]
9          \item A normal item
10         \item[\textbf{+}] A special item
11        \end{itemize}
12      \end{document}
```

then you will get the following information on the screen and in the `.log` file:

cleanup

```

[Template] ==> Using instance 'itemize' of type 'blockenv' on line 8
[Template] ==>   template: 'std'; arguments: |item-vspace=3pt|\BooleanFalse |\NoValue |\NoValue |

```

8 New and redefined kernel command

<code>\SimpleBlockEnv</code>	<i>to be documented</i>
<code>\BlockEnv</code>	
<code>\BlockEnvEnd</code>	
<code>\g_block_nesting_depth_int</code>	

<code>\legacyverbatimsetup</code>	<i>to be documented</i>
<code>\legacyallttsetup</code>	
<code>\legacylistsetup</code>	

<code>\@setupverbinvisiblespace</code>	A counterpart definition to the kernel command <code>\@setupverbinvisiblespace</code> , needed as we need to handle real space chars in verbatim.
--	---

<code>\newtheorem</code>	Reimplemented to fit the template approach. <code>\newtheoremstyle</code> was defined by <code>amsthm</code> .
<code>\newtheoremstyle</code>	

<code>\@nthm</code>	These are no longer used (to be removed).
<code>\@xnthm</code>	
<code>\@ynthm</code>	
<code>\@thm</code>	
<code>\@xthm</code>	
<code>\@ythm</code>	
<code>\@othm</code>	
<code>\@begintheorem</code>	
<code>\@opargbegintheorem</code>	
<code>\@endtheorem</code>	
<code>\item</code>	The <code>\item</code> is redefined.
<code>\@itemlabel</code>	
<code>\c@maxblocklevels</code>	A counter to increase or decrease the number of supported level. If increased, one needs to supply additional level instances.
<code>\begin</code>	The <code>\begin</code> is slightly redefined to handle <code>\doendpe</code> better. TODO: move to kernel
<code>\doendpe</code>	The original $\text{\LaTeX} 2_{\varepsilon}$ command is augmented to allow for tagging.
<code>\para_end:</code>	TODO: consider name, document
<code>para/begin</code>	The para/begin hook is enhanced to support list ends

Index
